Wireless LAN, Health and Authorization for use

Radio frequency electromagnetic energy is emitted from Wireless LAN devices. The energy levels of these emissions however are far much less than the electromagnetic energy emissions from wireless devices like for example mobile phones. Wireless LAN devices are safe for use frequency safety standards and recommendations. The use of Wireless LAN devices may be restricted in some situations or environments for example:

- On board of airplanes, or
- In an explosive environment, or
- In case the interference risk to other devices or services is perceived or identified as harmful

In case the policy regarding the use of Wireless LAN devices in specific organizations or environments (e.g. airports, hospitals, chemical/oil/gas industrial plants, private buildings etc.) is not clear, please ask for authorization to use these devices prior to operating the equipment.

Regulatory Information/disclaimers

Installation and use of this Wireless LAN device must be in strict accordance with the instructions included in the user documentation provided with the product. Any changes or modifications made to this device that are not expressly approved by the manufacturer may void the user's authority to operate the equipment. The Manufacturer is not responsible for any radio or television interference caused by unauthorized modification of this device, of the substitution or attachment. Manufacturer and its authorized resellers or distributors will assume no liability for any damage or violation of government regulations arising from failing to comply with these guidelines.

CE Mark Warning

This is a Class B product. In a domestic environment, this product may cause radio interference, in which case the user may be required to take adequate measures.

CE in which Countries where the product may be used freely:

Germany, UK, Italy, Spain, Belgium, Netherlands, Portugal, Greece, Ireland, Denmark, Luxembourg, Austria, Finland, Sweden, Norway and Iceland.

France: except the channel 10 through 13, law prohibits the use of other channels.

CE/EMC Restriction of Liability

The product described in this handbook was designed, produced and approved according to the EMC-regulations and is certified to be within EMC limitations.

If the product is used in an uncertified PC, the manufacturer undertakes no warranty in respect to the EMC limits. The described product in this handbook was constructed, produced and certified so that the measured values are within EMC limitations. In practice and under special circumstances, it may be possible, that the product may be outside of the given limits if it is used in a PC that is not produced under EMC certification. It is also possible in certain cases and under special circumstances, which the given EMC peak values will become out of tolerance. In these cases, the user himself is responsible for compliance with the EMC limits.

Declaration of Conformity

This equipment has been tested and found to comply with Directive 1999/5/CE of the European Parliament and of the Council on radio equipment and telecommunications terminal equipment and the mutual recognition of their conformity. After assessment, the equipment has been found to comply with the following standards: EN 300.328 (radio), EN 301 489-1, EN 301 489-17 (electromagnetic compatibility) and EN 60950 (safety). This equipment may be used in all European Union countries and in all countries applying Directive 1999/5/CE, without restriction, with the exception of the following countries:

France: When this equipment is used outdoors, output power is limited to within the frequency bans listed on the chart. For more info, consult the website www.art-telecom.fr.

Location	Frequency (MHz)	Band	Power (EIRP)
Indoor (no restriction)	2400-2483,5		100mW(20dBm)
Outdoor	2400-2454		100mW(20dBm)
	2454-2483,5		10mW(10dBm)

Italy: For more info, consult the website www.comunicazioni.it

WebShare 144WN

CHAPTER 1: Introduction

1.1 An Overview of WebShare Wireless N ADSL2+ Router

Broadband Sharing and IP sharing

The Wireless N ADSL2+ Router supports 4 x 10/100 Mbps auto-negotiating Fast Ethernet ports for connection to your PC or LAN and downstream (with built-in ADSL2+ modem) rate up to 24Mbps. Power by NAT technology, dozens of network users can surf on the Internet and share the ADSL connection simultaneously by using one ISP account and one single IP address.

Wireless

With integrated IEEE802.11n Wireless Access Point (up to 300Mbps), the device offers quick and easy access among wired network and wireless network. The Wireless Router also supports WPA/WPA2-PSK security, it increases the level of data protection and access control for Wireless LAN.

Wireless N and 3* 2.2 dBi Antennas provide extended coverage and low throughput fluctuations. Last but not least Wireless N technology offers an high throughput (up to 300Mbps) for HD Video Streaming.

Security: Firewall

This product also serves as an Internet firewall, protecting your network from being accessed by outside users. Not only provide the natural firewall function (Network Address Translation, NAT), it also provides rich firewall features to secure user's network.

Quality of Service (QoS)

QoS gives you full control over which types of outgoing data traffic should be given priority by the router, ensuring important data like gaming packets move through the router at lightning speed, even under heavy load. Using IP Throttling, bandwidth limits can be enforced on any system within your LAN, or even on a particular application.

Easy Configuration and Management

Support web based GUI and Telnet for configuration and management. Also supports remote management (Web and telnet) capability for remote user to configure and manage this product. It incorporates besides a client Dynamic DNS.

1.2 Package Contents

The package contains:

- WebShare Wireless N ADSL2+ Router
- Vera (Multilanguage Interactive Tutorial)
- CD-Rom containing the online manual
- RJ-11 ADSL/telephone Cable
- Ethernet (CAT-5 LAN) Cable

- AC-DC power adapter

1.3 WebShare Wireless N Router ADSL2+ Features

Technical characteristics of WebShare Wireless N Router ADSL2+:

ADSL Multi-Mode Standard: supports downstream rates of up to 24 Mbps and upstream rates of up to 1 Mbps. It also supports rate management that allows ADSL subscribers to select an Internet access speed suiting their needs and budgets. It is compliant with Multi-Mode standard (ANSI T1.413, Issue 2; G.dmt(G.992.1); G.lite(G992.2)), G.hs (G994.1), G.dmt.bis (G.992.3), G.dmt.bisplus (G.992.5)). The Annex A and B are supported in different H/W platforms.

Multi-Protocol to Establish A Connection: Supports PPPoA (RFC 2364 - PPP over ATM Adaptation Layer 5), RFC 1483 encapsulation over ATM (bridged or routed), PPP over Ethernet (RFC 2516) and IPoA (RFC1577) to establish a connection with the ISP. The product also supports VC-based and LLC-based multiplexing.

Fast Ethernet Switch: A 10/100Mbps fast Ethernet switch is built in with automatic switching between MDI and MDI-X for 10Base-T and 100Base-TX ports. An Ethernet straight or cross-over cable can be used directly for auto detection.

Wireless Ethernet 802.11g: With built-in 802.11g access point for extending the communication media to WLAN while providing the WEP and WPA for securing your wireless networks.

Network Address Translation (NAT): Allows multi-users to access outside resources such as the Internet simultaneously with one IP address/one Internet access account. Many application layer gateway (ALG) are supported such as web browser, ICQ, FTP, Telnet, E-mail, News, Net2phone, Ping, NetMeeting, IP phone and others.

Firewall: Supports simple firewall with NAT technology and provides option for blocking access from Internet, like Telnet, FTP, TFTP, WEB, SNMP and IGMP.

Domain Name System (DNS) relay: Provides an easy way to map the domain name (a friendly name for users such as www.yahoo.com) and IP address. When a local machine sets its DNS server with this router's IP address, every DNS conversion request packet from the PC to this router will be forwarded to the real DNS in the outside network.

PPP over Ethernet (PPPoE): Provides embedded PPPoE client function to establish a connection. Users can get greater access speed without changing the

operation concept, sharing the same ISP account and paying for one access account. No PPPoE client software is required for local computer. The Automatic Reconnect and Disconnect Timeout (Idle Timer) functions are provided, too.

Dynamic Host Control Protocol (DHCP) client and server: In the WAN site, the DHCP client can get an IP address from the Internet Service Provider (ISP) automatically. In the LAN site, the DHCP server can allocate a range of client IP addresses and distribute them including IP address, subnet mask as well as DNS IP address to local computers. It provides an easy way to manage the local IP network.

RIP1/2 Routing: Supports RIP1/2 routing protocol for routing capability.

Web based GUI: Supports web based GUI for configuration and management. It is user-friendly and comes with on-line help. It also supports remote management capability for remote users to configure and manage this product.

Quick Installation Wizard: Supports a WEB GUI page to install this device quickly. With this wizard, end users can enter the information easily which they get from their ISP, then surf the Internet immediately.

Packet Filtering: Up to 72 rules.

Universal Plug and Play (UPnP) e UPnP NAT Traversal: This protocol is used to enable simple and robust connectivity among stand-alone devices and PCs from many different vendors. It makes network simple and affordable for users. UPnP architecture leverages TCP/IP and the Web to enable seamless proximity networking in addition to control and data transfer among networked devices. With this feature enabled, users can now connect to Net meeting or MSN Messenger seamlessly.

Virtual Server: User can specify some services to be visible from outside users. The router can detect incoming service request and forward it to the specific local computer to handle it. For example, user can assign a PC in LAN acting as WEB server inside and expose it to the outside network. Outside user can browse inside web server directly while it is protected by NAT. A DMZ host setting is also provided to a local computer exposed to the outside network, Internet.

1.4 WebShare Wireless N Router ADSL2+ Application

Follow the followings steps to cabling the device:

- Connect WAN Port to the telephone line through RJ-11 cable (contained in package).
- WebShare Wireless N ADSL2+ Router can be connect in the following configuration:
 - Directly at 4 PC, through CAT5 cables (one is contained in package)
 - To an Hub/Switch through UPLINK Port through CAT 5 cable (contained in package).
- Connect AC-DC Adapter on AC and on device (POWER jack) in the rear of the product.

- | | |
|----------------------------------|------------------------------|
| ① 2.2 dBi Fixed Antennas | ④ Reset Button |
| ② RJ11 ADSL Line | ⑤ Receptor for Power Adapter |
| ③ 4 x RJ45 10/100Base-T Ethernet | ⑥ WPS Button |

CHAPTER 2: Using WebShare Wireless N ADSL2+ Router

2.1 Cautions for using the WebShare Wireless N ADSL2+ Router

- Do not place the Wireless N ADSL2+ Router under high humidity and high temperature.
- Do not use the same power source for Wireless N ADSL2+ Router with other equipment.
- Do not open or repair the case yourself.
- If the Wireless N ADSL2+ Router is too hot, turn off the power immediately and have a qualified serviceman repair it.
- Place the Wireless N ADSL2+ Router on a stable surface.
- Only use the power adapter that comes with the package.
- Do NOT upgrade firmware on any Atlantis Land product over a wireless connection.

2.2 The Front LEDs

In the front of WebShare Wireless N ADSL2+ Router, you can see a LED series that show status of some functionality of product.

Following table contains meaning of front LEDs:

LED	Meaning
PWR	Lit when power is ON.
LAN	Lit when connected to Ethernet device. Blue for 100Mbps; Orange for 10Mbps. Blinking when data transmit/received.

WLAN	Flashes green when the wireless connection is established. Flashes when sending/receiving data.
WPS	Lit when WPS is ON.
ADSL	Lit when successfully connected to an ADSL DSLAM (“linesync”).
PPP	Lit red when WAN port fails to get IP address. Lit blue when WAN port gets IP address successfully.

2.3 The Rear Ports

Ports	Meaning
ADSL(Line)	Connect the supplied RJ-11 (“telephone”) cable to this port when connecting to the ADSL/telephone network.
LAN	Connect a UTP Ethernet cable (Cat-5 or Cat-5e) to one of the four LAN ports when connecting to a PC or an office/home network of 10Mbps or 100Mbps.
Reset	After the device is powered on, press it to reset the device or restore to factory default settings. <ul style="list-style-type: none"> • 0-3 seconds: reset the device • 3-5 seconds: no action • Over 10 seconds: restore to factory default settings (this is used when you can not login to the router, e.g. forgot the password).
WPS	Push the WPS button to trigger the Wi-Fi Protected Setup function.
POWER (jack)	Connect the supplied power adapter to this jack.

2.4 Cabling

The most common problem is bad cabling or ADSL line. Make sure that all connected devices are turned on. On the front of the product is a bank of LEDs. As a first check, verify that the LAN Link, ADSL, PWR, SYS LEDs are lit.

If they are not, verify that you are using the proper cables.

Ensure that all other devices connected to the same telephone line as your router (e.g. telephones, fax machines, analog modems) have a line filter (**A01-AF2**) connected between them and the wall socket (unless you are using a Central Splitter or Central Filter installed by a qualified and licensed electrician), and ensure that all line filters are correctly installed and the right way around.

Application Scheme

CHAPTER 3: Configuration

WebShare Wireless N ADSL2+ Router can be configured with your web browser. A web browser is included as a standard application in the following operating systems: Windows 98/NT/2000/XP/Me, MAC, Linux, etc. The product provides a very easy and user-friendly interface for configuration.

3.1 Before Configuration

PCs must have an Ethernet interface installed properly and be connected to the router either directly or through an external repeater hub, and have TCP/IP installed and configured to obtain an IP address through a DHCP server or a fixed IP address that must be in the same subnet as the router. The default IP address of the router is **192.168.1.254** and the subnet mask is **255.255.255.0** (i.e. any attached PC must be in the same subnet, and have an IP address in the range of 192.168.1.1 to 192.168.1.253). The best and easiest way is to configure the PC to get an IP address automatically from the router using DHCP. If you encounter any problems accessing the router's web interface it may also be advisable to **uninstall** any kind of software firewall on your PCs, as they can cause problems accessing the 192.168.1.254 IP address of the router. Users should make their own decisions on how to best protect their network.

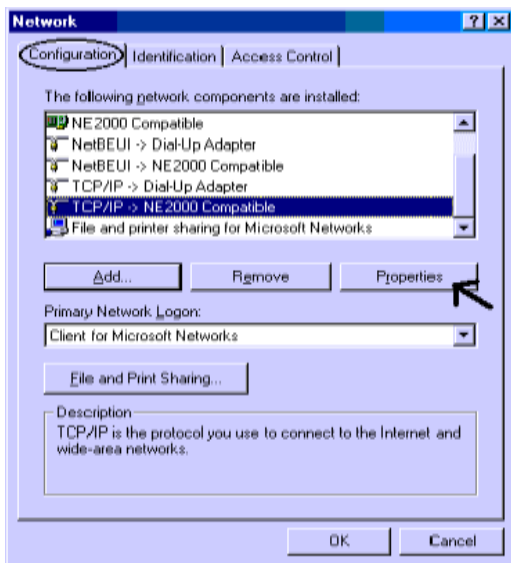

Please follow the steps below for your PC's network environment installation. First of all, please check your PC's network components. The TCP/IP protocol stack and Ethernet network adapter must be installed. If not, please refer to your Windows-related or other operating system manuals.

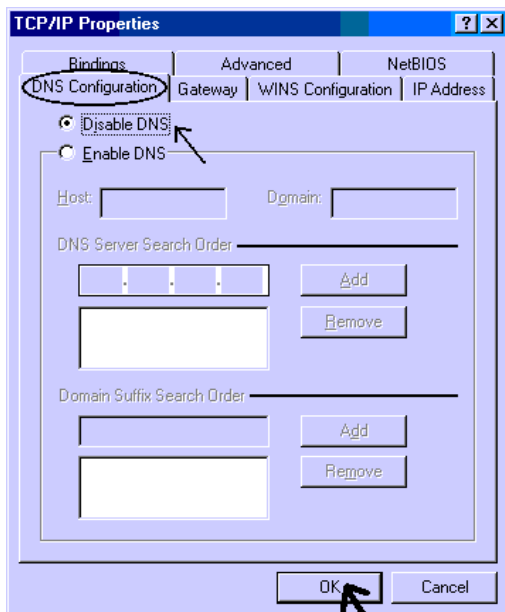

Any TCP/IP capable workstation can be used to communicate with or through the WebShare Wireless N ADSL2+ Router. To configure other types of workstations, please consult the manufacturer's documentation.

3.1.1 Configuring PC for Windows 95/98/ME

1. Go to **Start / Settings / Control Panel**. In the Control Panel, double-click on **Network** and choose the **Configuration** tab.
 1. Select **TCP / IP -> NE2000 Compatible**, or the name of any Network Interface Card (NIC) in your PC.
 2. Click Properties.

3. Select the **IP Address tab**. In this page, click the **Obtain an IP address automatically** radio button.
2. Then select the **DNS Configuration tab**.
3. Select the **Disable DNS** radio button and click **“OK”** to finish the configuration.

3.1.2 Configuring PC for Windows NT4.0

1. Go to **Start / Settings / Control Panel**. In the Control Panel, double-click on **Network** and choose the **Protocols** tab.

2. Select **TCP/IP Protocol** and click **Properties**.

3. Select the **Obtain an IP address from a DHCP server** radio button and click **OK**.

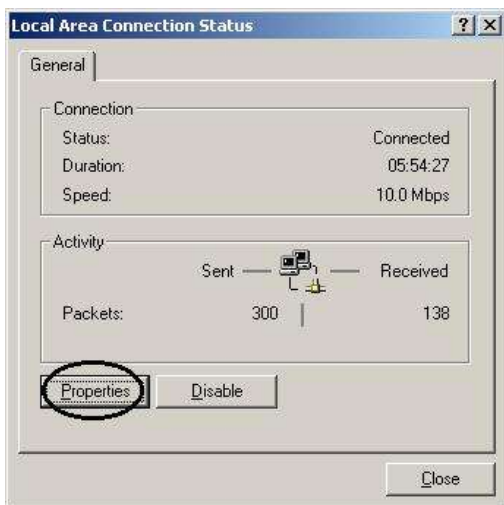

3.1.3 Configuring PC for Windows 2000

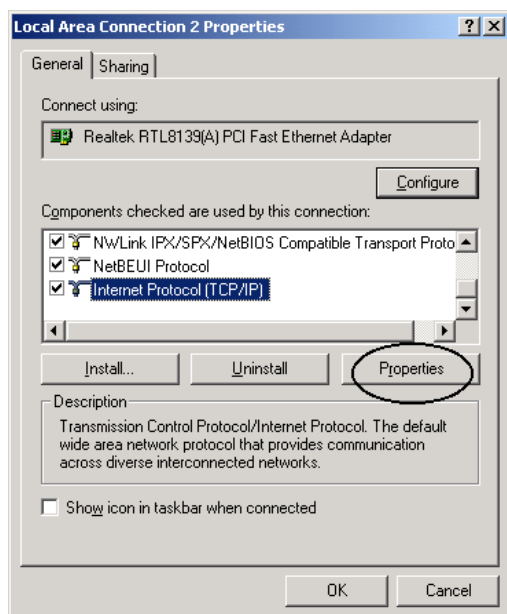

1. Go to **Start / Settings / Control Panel**. In the Control Panel, double-click on **Network and Dial-up Connections**.
2. Double-click **LAN Area Connection**.

3. In the **LAN Area Connection Status** window, click **Properties**.

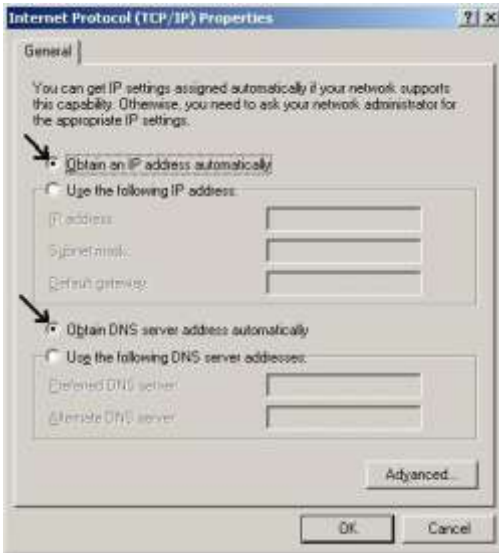

4. Select **Internet Protocol (TCP/IP)** and click **Properties**

5. Select the **Obtain an IP address automatically** and the **Obtain DNS server address automatically** radio buttons.

6. Click **“OK”** to finish the configuration.

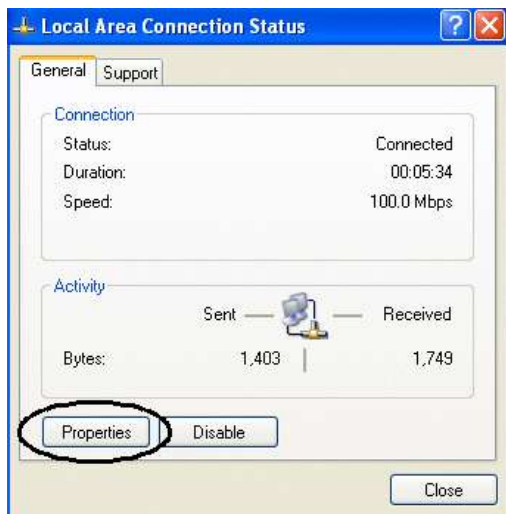

3.1.4 Configuring PC for Windows XP

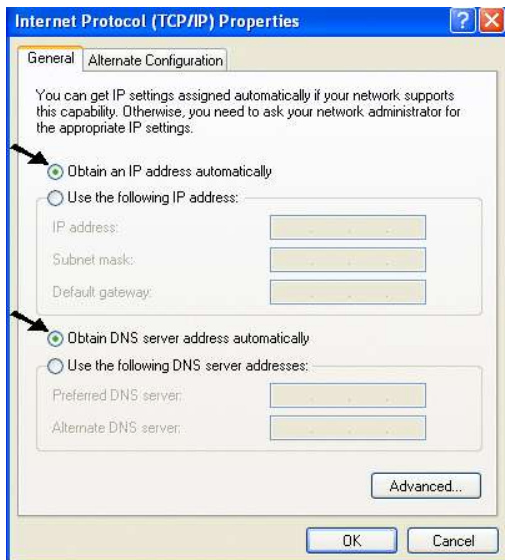

1. Go to **Start / Control Panel** (in Classic View). In the Control Panel, double-click on **Network Connections**.
2. Double-click **Local Area Connection**

3. In the **LAN Area Connection Status** window, click **Properties**.
4. Select **Internet Protocol (TCP/IP)** and click **Properties**.

5. Select the **Obtain an IP address automatically** and the **Obtain DNS server address automatically** radio buttons.
6. Click **“OK”** to finish the configuration.

3.1.5 Configuring PC for Windows Vista

1. Go to **Start / Control Panel (in Classic View)**. In the Control Panel, double-click on **Network and Sharing Center** icon.
2. Click **Manage the Network** then double-click **Local Area Connection**. Click **Continue** (Windows needs your permission to continue).
3. In the **LAN Area Connection Status** window, click **Properties**.
4. Select **Internet Protocol (TCP/IP)** and click **Properties**.
5. Select the **Obtain an IP address automatically** and the **Obtain DNS server address automatically** radio buttons.
6. Click **OK** to finish the configuration

3.1.6 Configuring for MAC

1. Click on Apple Menu and select **Control Panel/TCP/IP**. It will appear the follow screen.
2. Select **Ethernet** on **Connect Via**.
3. Select **Using DHCP Server** on **Configure**.
4. Leave empty the field **DHCP Client ID**.

3.1.6 Verification of Configuration

To verify your correct configuration (after PC restart, necessary for Windows 98, 98Se, ME and instead enough obtain IP lease for XP, 2000), use ping command. From a DOS Window, type:

ping 192.168.1.254.

If It show you this message:

***Pinging 192.168.1.254 with 32 bytes of data:
Reply from 192.168.1.254: bytes=32 times<10ms TTL=64
Reply from 192.168.1.254: bytes=32 times<10ms TTL=64
Reply from 192.168.1.254: bytes=32 times<10ms TTL=64***

It i s possible to continue to follow step. If it show you follow message:

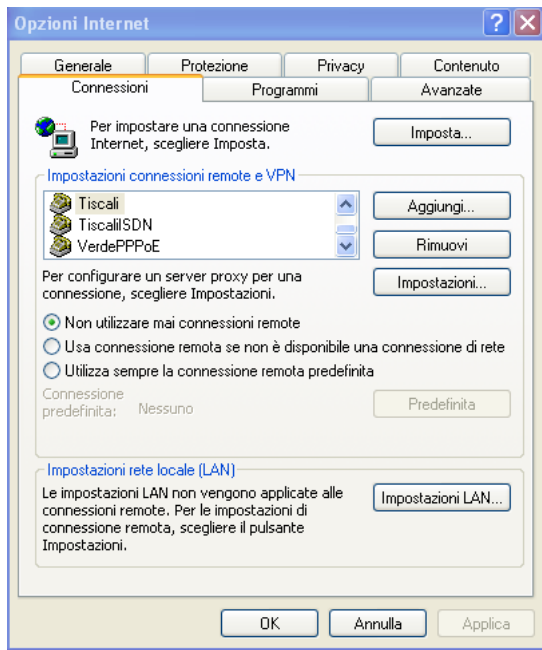

***Pinging 192.168.1.254 with 32 bytes of data:
Request timed out.
Request timed out.
Request timed out.***

Check that LAN LED is lit (change CAT cable if is not). Check PC IP Address typing **winipcfg** for (Win95,98,ME) or **ipconfig** (for Win2000,XP) and eventually re-install TCP/IP stack.

3.1.7 Browser Configuration

Now open IE, go to **Instruments** menu, select the **Connections** tab and select one of the following options:

- Never use remote connection
- Use remote connection if another network connection isn't available

3.2 Factory Default Setting

Before configuring your, you need to know the following default settings:

- Username: **admin**
- Password: **atlantis**
- IP Address (**192.168.1.254**)
- Subnet Mask (**255.255.255.0**)
- ISP Setting in WAN Side = **PPPoA, VCMux, Routing, VPI=8, VCI=35**
- **DHCP Server enabled** with IP pool from **192.168.1.100** to **192.168.1.199**
- **Wireless: SSSID= A02-RA144-W300N, Channel=6, WEP=disable**

3.2.1 Password

The default username and password are **admin** and **atlantis** respectively.

If you ever forget the password to log in, you may press the RESET button up to 6 seconds to restore the factory default settings.

3.2.2 LAN and WAN Port Addresses

The parameters of LAN and WAN ports are pre-set in the factory. The default values are shown below.

Porta LAN		Porta WAN
IP address	192.168.1.254	Mode= Routing
Subnet Mask	255.255.255.0	Encapsulation= PPPoA
DHCP server function	Enabled	Multiplex= VC
IP addresses for distribution to PCs	100 IP addresses continuing from 192.168.1.100 through 192.168.1.199	VPI= 8 VCI= 35

3.3 Reset of WebShare Wireless N ADSL2+ Router

If you forget the password, you can restore router with Default Factory Setting using “Reset” button in the rear of the product. To do this operation is necessary be sure that led SYS is lit, then press “Reset” button for 10 seconds. The LED SYS will turn off and it will blink; it will be lit when firmware with Factory Default Setting will be loaded. Now you can enter on WebShare Wireless N ADSL2+ Router with password “atlantis”.

3.4 Informations from the ISP

Before configuring this device, you have to check with your ISP (Internet Service Provider) what kind of service is provided such as PPPoE, PPPoA, RFC1483, or IPoA.

Gather the information as illustrated in the following table and keep it for reference.

PPPoE	VPI/VCI, VC-based/LLC-based multiplexing, Username, Password, Service Name, and Domain Name System (DNS) IP address (it can be automatically assigned by your ISP when you connect or be set manually).
PPPoA	VPI/VCI, VC-based/LLC-based multiplexing, Username, Password, and Domain Name System (DNS) IP address (it can be automatically assigned by your ISP when you connect or be set manually).
RFC1483 Bridged	VPI/VCI, VC-based/LLC-based multiplexing to use Bridged Mode.
RFC1483 Routed	VPI/VCI, VC-based/LLC-based multiplexing, IP address, Subnet mask, Gateway address, and Domain Name System (DNS) IP address (it is fixed IP address).

3.5 Browser Configuration

Open your web browser, enter the IP address of your router, which by default is **192.168.1.254**, and click “Go”.

The default username and password are “**admin**” and “**atlantis**”.

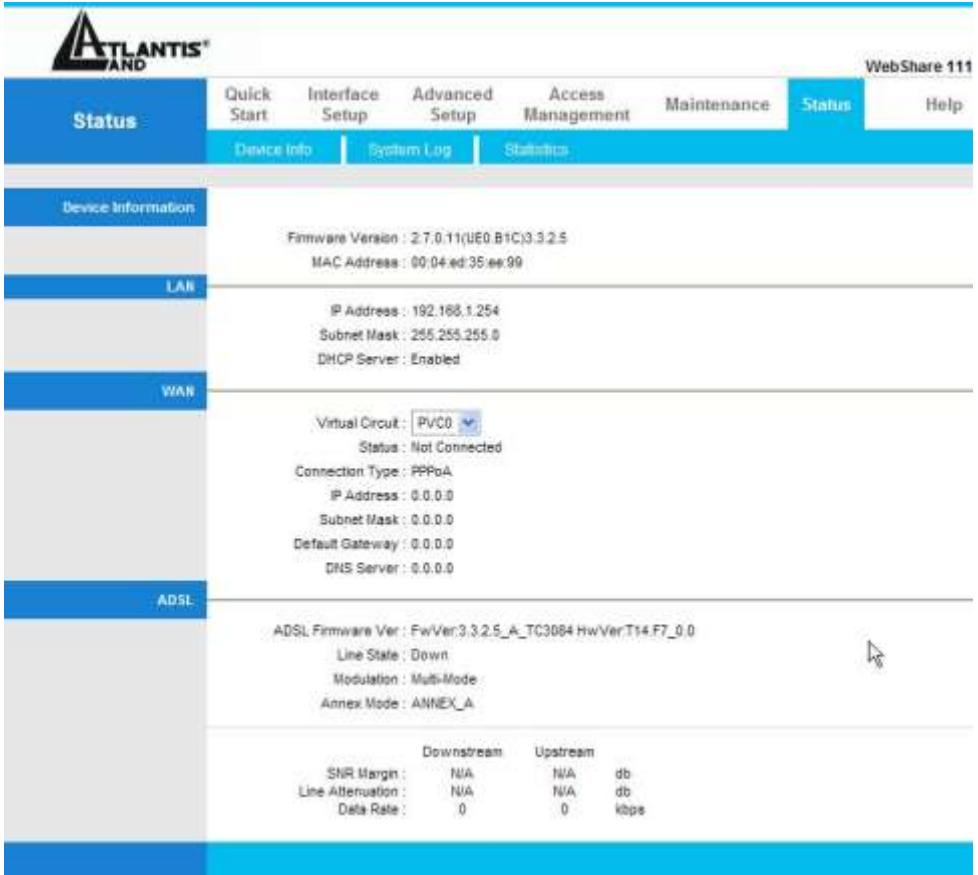

You will get a status report web page when login successfully.

3.6 Surfing in Web GUI Configuration

This section describe how to surf on Site Map configuration Interface.

- **Quick Start** (Run Wizard)
- **Interface Setup**(Internet, LAN, Wireless)
- **Advanced Setup**(Routing, NAT, ADSL)
- **Access Management**(ACL, IP Filter, SNMP, UPnP, QoS, DDNS)
- **Maintenance**(Administration, Time Zone, Firmware, SysRestart, Diagnostics)
- **Status**(Device Info, System Log, Statistics)
- **Help**

Click on the desired item to expand the page with all settings in the main navigation panel.

3.7 Configuring Password

It is highly recommended that you change the password for accessing the ADSL Router. To change the ADSL Router' password, click **Maintenance** and then **Administration** . The screen appears as shown.

The following table describes the labels in this screen.

Label	Description
New Password	Type the new password in this field.
Confirm Password	Type the new password again in this field.
Save	Click Apply to save your changes back to the ADSL Router.
Cancel	Click Cancel to begin configuring this screen afresh.

3.8 Resetting the ADSL Router

If you forget your password or cannot access the WebShare Wireless Router ADSL2+, you will need to reload the factory-default configuration file or use the RESET button the back of the ADSL Router. Uploading this configuration file replaces the current configuration file with the factory-default configuration file.

3.8.1 Using The Reset Button

- Step 1. Make sure the SYS LED is on (not blinking).
- Step 2. Press the RESET button for 10 (or more) seconds, and then release it. When the SYS LED begins to blink, the defaults have been restored and the ADSL Router restarts.

CHAPTER 4: Quick Start

This chapter provides information on the Wizard Setup screens in the web configurator.

4.1 Wizard Setup Introduction

Use the Wizard Setup screens to configure your system for Internet access settings and fill in the fields with the information in the Internet Account Information table of the Compact Guide or Read Me First. Your ISP may have already configured some of the fields in the wizard screens for you.

4.2 Encapsulation

Be sure to use the encapsulation method required by your ISP. The ADSL Router supports the following methods.

4.2.1 PPP over Ethernet

PPPoE provides access control and billing functionality in a manner similar to dial-up services using PPP. The ADSL Router bridges a PPP session over Ethernet (PPP over Ethernet, RFC 2516) from your computer to an ATM PVC (Permanent Virtual Circuit) which connects to ADSL Access Concentrator where the PPP session terminates. One PVC can support any number of PPP sessions from your LAN. For more information on PPPoE, see the appendix.

4.2.2 PPPoA

PPPoA stands for Point to Point Protocol over ATM Adaptation Layer 5 (AAL5). It provides access control and billing functionality in a manner similar to dial-up services using PPP. The ADSL Router encapsulates the PPP session based on RFC1483 and sends it through an ATM PVC (Permanent Virtual Circuit) to the Internet Service Provider's (ISP) DSLAM (digital access multiplexer). Please refer to RFC 2364 for more information on PPPoA. Refer to RFC 1661 for more information on PPP.

4.2.3 RFC 1483

RFC 1483 describes two methods for Multiprotocol Encapsulation over ATM Adaptation Layer 5 (AAL5). The first method allows multiplexing of multiple protocols over a single ATM virtual circuit (LLC-based multiplexing) and the second method assumes that each protocol is carried over a separate ATM virtual circuit (VC-based multiplexing). Please refer to the RFC for more detailed information.

4.3 Multiplexing

There are two conventions to identify what protocols the virtual circuit (VC) is carrying. Be sure to use the multiplexing method required by your ISP.

4.3.1 VC-based Multiplexing

In this case, by prior mutual agreement, each protocol is assigned to a specific virtual circuit; for example, VC1 carries IP, etc. VC-based multiplexing may be dominant in environments where dynamic creation of large numbers of ATM VCs is fast and economical.

4.3.2 LLC-based Multiplexing

In this case one VC carries multiple protocols with protocol identifying information being contained in each packet header. Despite the extra bandwidth and processing overhead, this method may be advantageous if it is not practical to have a separate VC for each carried protocol, for example, if charging heavily depends on the number of simultaneous VCs.

4.4 VPI and VCI

Be sure to use the correct Virtual Path Identifier (VPI) and Virtual Channel Identifier (VCI) numbers assigned to you. The valid range for the VPI is 0 to 255 and for the VCI is 32 to 65535 (0 to 31 is reserved for local management of ATM traffic). Please see the appendix for more information.

4.5 Quick Start

Following next steps you can make operating WebShare Wireless N ADSL2+ Router in short time using PCs in DHCP mode. Refer to manual on Installation CD if you need personalized configuration.

Click on **Quick Start** then **Run Wizard** to perform an automatic protocol selection.

The following screen will appear. Please click **Next** to continue.

Quick Start

The Wizard will guide you through these four quick steps. Begin by clicking on **NEXT**.

- Step 1. Set your new password
- Step 2. Choose your time zone
- Step 3. Set your Internet connection
- Step 4. Re-start your ADSL router

NEXT **EXIT**

You can change the password as you like and then click **Next** to continue. Select your time zone from the drop down list. Please click **Next** to continue. Select how the router will set up the Internet connection: **PPPoE/PPPoA**: to obtain IP automatically (You need username and password). **Static IP address**: this configuration is valid in case of a subscription with a static IP.

Quick Start - ISP Connection Type

Select the internet connection type to connect to your ISP. Click **NEXT** to continue.

- Dynamic IP Address Choose this option to obtain a IP address automatically from your ISP.
- Static IP Address Choose this option to set static IP information provided to you by your ISP.
- PPPoE/PPPoA Choose this option if your ISP uses PPPoE/PPPoA. (For most DSL users)
- Bridge Mode Choose this option if your ISP uses Bridge Mode.

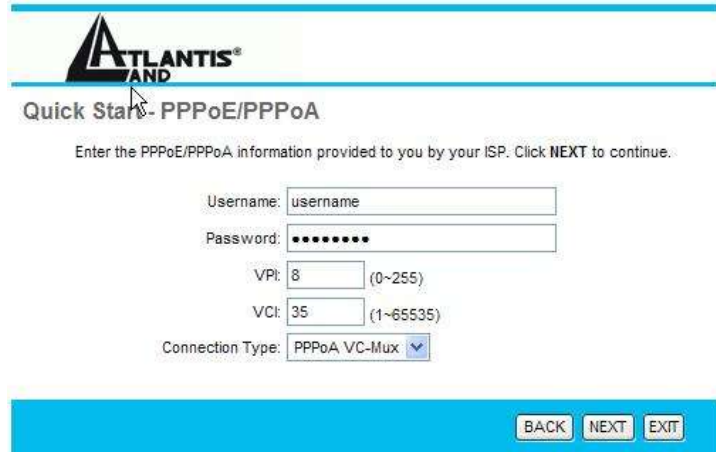

BACK **NEXT** **EXIT**

PPPoE/PPPoA

PPPoE (PPP over Ethernet) is an ADSL connection known as dial-up DSL. As the PPPoA it has been created to integrate large band services paying a particular attention to an easy configuration. The user can obtain an high access speed and he can also share the same account with the ISP. No additional software are required. This configuration is valid in case of a subscription with a

static IP and active NAT (SUA) (for the managing of the public class turn to the CD handbook). Let's see how to configure correctly this kind of ADSL configuration.

Insert **Username** and **Password** and make sure that the parameters are, in case of **PPPoA**, the ones in the picture, if not specifically shown by the ISP.

Quick Start - PPPoE/PPPoA

Enter the PPPoE/PPPoA information provided to you by your ISP. Click NEXT to continue.

Username:

Password:

VPI: (0~255)

VCI: (1~65535)

Connection Type:

In case of **PPPoE** choose **Connection Type=PPPoE LLC**.
Click on **Next**.

You have to pay particular attention to the WAN-ADSL connection. If you have any doubt turn to qualified personnel or contact Atlantis-Land technical assistance. Atlantis Land will not be considered responsible in case of wrong or bad configuration.

STATIC IP ADDRESS

This configuration is valid in case of a subscription with a static IP and active NAT SUA (for the managing of the public class turn to the CD Manual). Make sure that the parameters are, in case of **RFC1483**, the ones in the picture, if not specifically shown by the ISP.

Insert then the public static IP address given by the ISP and choose **Connection Type=1483 Routed IP LLC(IPoA)**. Make sure that the parameters are, the ones in the picture, if not specifically shown by the ISP.

Quick Start - Static IP Address

Enter the static IP information provided to you by your ISP. Click **NEXT** to continue.

VPI:	<input type="text" value="8"/>	(0~255)
VCI:	<input type="text" value="35"/>	(1~65535)
IP Address:	<input type="text" value="0.0.0.0"/>	
Subnet mask:	<input type="text" value="0.0.0.0"/>	
ISP Gateway:	<input type="text" value="0.0.0.0"/>	
Connection Type:	<input type="text" value="1483 Routed IP LLC(PoA)"/>	

Click on **Next**.

4.6 Wizard Setup Configuration: Connection Tests

Launch your web browser and navigate to www.atlantis-land.com Internet access is just the beginning. Refer to the rest of this User's Guide for more detailed information on the complete range of ADSL Router features. If you cannot access the Internet, open the web configurator again to confirm that the Internet settings you configured in the Wizard Setup are correct.

The Webshare Wireless N ADSL2+ Router automatically tests the connection to the computer(s) connected to the LAN ports. To test the connection from the ADSL Router to the ISP, click **Maintenance** then **Diagnose**.

CHAPTER 5: LAN Setup

This chapter describes how to configure LAN settings.

5.1 LAN Overview

A Local Area Network (LAN) is a shared communication system to which many computers are attached. A LAN is a computer network limited to the immediate area, usually the same building or floor of a building.

The LAN screens can help you configure a LAN DHCP server and manage IP addresses.

5.1.1 LANs, WANs and the ADSL Router

The actual physical connection determines whether the ADSL Router ports are LAN or WAN ports. There are two separate IP networks, one inside, the LAN network; the other outside: the WAN network as shown next:

5.2 DNS Server Address

DNS (Domain Name System) is for mapping a domain name to its corresponding IP address and vice versa, for example, the IP address of www.atlantis-land.com is 204.217.0.2. The DNS server is extremely important because without it, you must know the IP address of a machine before you can access it. The DNS server addresses that you enter in the DHCP setup are passed to the client machines along with the assigned IP address and subnet mask.

There are two ways that an ISP disseminates the DNS server addresses. The first

is for an ISP to tell a customer the DNS server addresses, usually in the form of an information sheet, when s/he signs up. If your ISP gives you the DNS server addresses, enter them in the DNS Server fields in DHCP Setup, otherwise, leave them blank.

Some ISP's choose to pass the DNS servers using the DNS server extensions of PPP IPCP (IP Control Protocol) after the connection is up. If your ISP did not give you explicit DNS servers, chances are the DNS servers are conveyed through IPCP negotiation. The ADSL Router supports the IPCP DNS server extensions through the DNS proxy feature.

If the Primary and Secondary DNS Server fields in DHCP Setup are not specified, for instance, left as 0.0.0.0, the ADSL Router tells the DHCP clients that it itself is the DNS server. When a computer sends a DNS query to the ADSL Router, the ADSL Router forwards the query to the real DNS server learned through IPCP and relays the response back to the computer.

Please note that DNS proxy works only when the ISP uses the IPCP DNS server extensions. It does not mean you can leave the DNS servers out of the DHCP setup under all circumstances. If your ISP gives you explicit DNS servers, make sure that you enter their IP addresses in the DHCP Setup menu. This way, the ADSL Router can pass the DNS servers to the computers and the computers can query the DNS server directly without the ADSL Router's intervention.

5.3 DNS Server Address Assignment

Use DNS (Domain Name System) to map a domain name to its corresponding IP address and vice versa. The DNS server is extremely important because without it, you must know the IP address of a computer before you can access it.

There are two ways that an ISP disseminates the DNS server addresses.

1. The ISP tells you the DNS server addresses, usually in the form of an information sheet, when you sign up. If your ISP gives you DNS server addresses, enter them in the DNS Server fields in DHCP Setup.
2. Leave the DNS Server fields in DHCP Setup blank (for example 0.0.0.0). The ADSL Router acts as a DNS proxy when this field is blank.

5.4 LAN TCP/IP

The ADSL Router has built-in DHCP server capability that assigns IP addresses and DNS servers to systems that support DHCP client capability.

5.4.1 Factory LAN Defaults

The LAN parameters of the ADSL Router are preset in the factory with the following values:

IP address of 192.168.1.254 with subnet mask of 255.255.255.0 (24 bits)

DHCP server enabled with 100 client IP addresses starting from 192.168.1.100.

These parameters should work for the majority of installations. If your ISP gives you explicit DNS server address(es), read the embedded web configurator help regarding what fields need to be configured.

5.4.2 IP Address and Subnet Mask

Refer to the IP Address and Subnet Mask section in the Wizard Setup chapter for this information.

5.4.3 RIP Setup

RIP (Routing Information Protocol) allows a router to exchange routing information with other routers. The RIP **Direction** field controls the sending and receiving of RIP packets. When set to:

1. **Both** - the ADSL Router will broadcast its routing table periodically and incorporate the RIP information that it receives.
2. **In Only** - the ADSL Router will not send any RIP packets but will accept all RIP packets received.
3. **Out Only** - the ADSL Router will send out RIP packets but will not accept any RIP packets received.
4. **None** - the ADSL Router will not send any RIP packets and will ignore any RIP packets received.

The **Dynamic Route** field controls the format and the broadcasting method of the RIP packets that the ADSL Router sends (it recognizes both formats when receiving). RIP-1 is universally supported; but RIP-2 carries more information. RIP-1 is probably adequate for most networks, unless you have an unusual network topology.

Both RIP-2B and RIP-2M sends the routing data in RIP-2 format; the difference being that RIP-2B uses subnet broadcasting while RIP-2M uses multicasting.

5.4.4 Multicast

Traditionally, IP packets are transmitted in one of either two ways - Unicast (1 sender - 1 recipient) or Broadcast (1 sender - everybody on the network). Multicast delivers IP packets to a group of hosts on the network - not everybody and not just 1.

IGMP (Internet Group Multicast Protocol) is a network-layer protocol used to

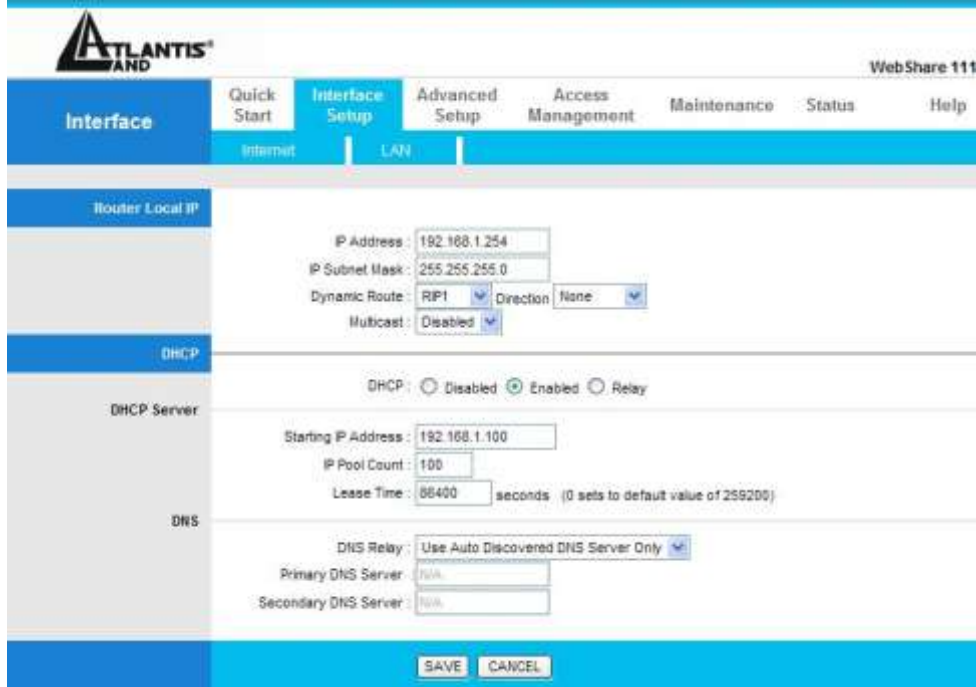

establish membership in a Multicast group - it is not used to carry user data. IGMP version 2 (RFC 2236) is an improvement over version 1 (RFC 1112) but IGMP version 1 is still in wide use. If you would like to read more detailed information about interoperability between IGMP version 2 and version 1, please see sections 4 and 5 of RFC 2236. The class D IP address is used to identify host groups and can be in the range 224.0.0.0 to 239.255.255.255. The address 224.0.0.0 is not assigned to any group and is used by IP multicast computers. The address 224.0.0.1 is used for query messages and is assigned to the permanent group of all IP hosts (including gateways). All hosts must join the 224.0.0.1 group in order to participate in IGMP. The address 224.0.0.2 is assigned to the multicast routers group.

The ADSL Router supports both IGMP version 1 (IGMP-v1) and IGMP version 2 (IGMP-v2). At start up, the ADSL Router queries all directly connected networks to gather group membership. After that, the ADSL Router periodically updates this information. IP multicasting can be enabled/disabled on the ADSL Router LAN and/or WAN interfaces in the web configurator (LAN; WAN). Select None to disable IP multicasting on these interfaces.

5.5 Configuring LAN

Click “**Interface Setup**” then “**LAN**” to open the following screen.

The screenshot shows the 'Interface Setup' screen for the LAN interface. The top navigation bar includes 'Quick Start', 'Interface Setup', 'Advanced Setup', 'Access Management', 'Maintenance', 'Status', and 'Help'. The 'Interface Setup' tab is active, and the 'LAN' sub-tab is selected. The main content area is divided into three sections: 'Router Local IP', 'DHCP', and 'DNS'. The 'Router Local IP' section includes fields for 'IP Address' (192.168.1.254), 'IP Subnet Mask' (255.255.255.0), 'Dynamic Route' (RIP1), 'Direction' (None), and 'Multicast' (Disabled). The 'DHCP' section has radio buttons for 'Disabled', 'Enabled', and 'Relay', with 'Enabled' selected. Below this are fields for 'Starting IP Address' (192.168.1.100), 'IP Pool Count' (100), and 'Lease Time' (86400 seconds). The 'DNS' section includes a 'DNS Relay' dropdown menu (set to 'Use Auto Discovered DNS Server Only'), and fields for 'Primary DNS Server' and 'Secondary DNS Server' (both set to '192.168.1.1'). At the bottom, there are 'SAVE' and 'CANCEL' buttons.

The following table describes the labels in this screen.

Router Local IP

IP Address	Enter the IP address of the ADSL Router in dotted decimal notation, for example, 192.168.1.254 (factory default).
IP Subnet Mask	Type the subnet mask assigned to you by your ISP (if given).
RIP Direction	Select the RIP direction from None, Both, In Only and Out Only.
RIP Version	Select the RIP version from RIP-1, RIP-2B and RIP-2M.
Multicast	IGMP (Internet Group Multicast Protocol) is a session-layer protocol used to establish membership in a multicast group. The ADSL Router supports both IGMP version 1 (IGMP-v1) and IGMP-v2. Select None to disable it.
Save	Click this button to save these settings back to the ADSL Router.
Cancel	Click this button to reset the fields in this screen.

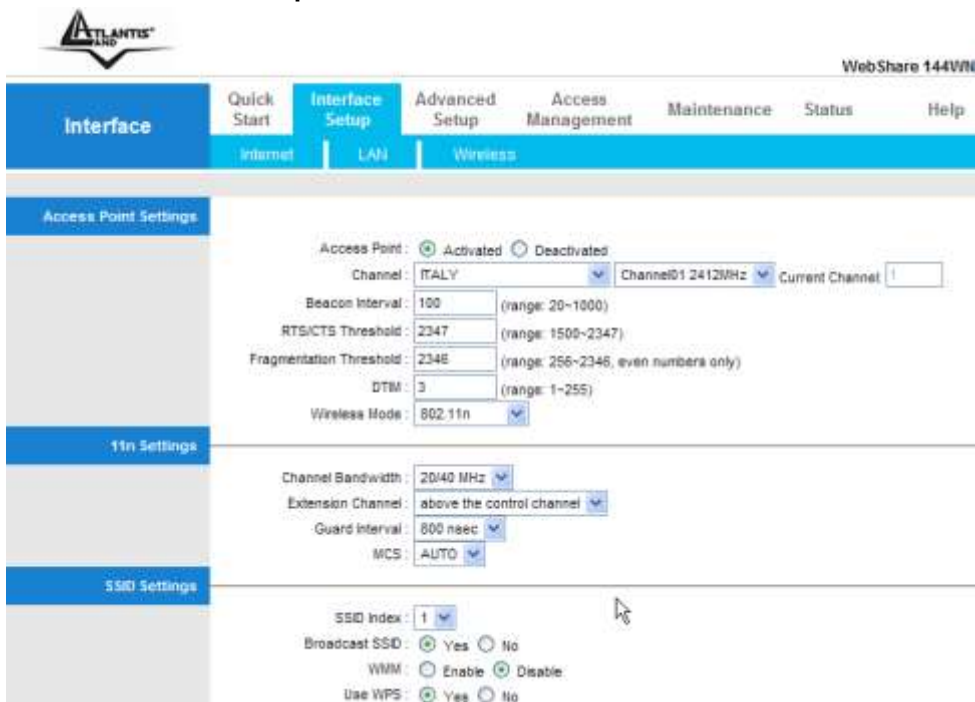

DHCP

Label	Description
DHCP	<p>If set to Enabled, the ADSL Router can assign IP addresses, an IP default gateway and DNS servers to Windows 95, Windows NT and other systems that support the DHCP client. If set to Disabled, the DHCP server will be disabled.</p> <p>If set to Relay, the ADSL Router acts as a surrogate DHCP server and relays DHCP requests and responses between the remote server and the clients. Enter the IP address of the actual, remote DHCP server in the Remote DHCP Server field in this case.</p> <p>When DHCP is used, the following items need to be set:</p>
Starting IP Address	This field specifies the first of the contiguous addresses in the IP address pool.
IP Pool count	This field specifies the size or count of the IP address pool.
Lease Time	This field specifies the length of time for the IP lease.
DNS Relay	If user want to disable this feature, he just need to set both Primary and secondary DNS IP to 0.0.0.0. Using DNS relay, users can setup DNS server IP to 192.168.1.1 on their Computer. If not, device will perform as no DNS relay.
Primary DNS Server	Enter the IP addresses of the DNS servers. The DNS servers are passed to the DHCP clients along with the IP address and the subnet mask.
Secondary DNS Server	As above.
Save	Click this button to save these settings back to the ADSL Router.
Cancel	Click this button to reset the fields in this screen.

5.6 Wireless

This section introduces the wireless LAN and some basic configurations. Wireless LANs can be as simple as two computers with wireless LAN cards communicating in a peer-to-peer network or as complex as a number of computers with wireless LAN cards communicating through access points which bridge network traffic to the wired LAN.

Click on “**Interface Setup**” then “**Wireless**”.

Access Point Settings

Label	Description
Access Point	Default setting is set to Activated . If you do not have any wireless, both 802.11g and 802.11b, device in your network, select Deactivated .
Channel ID	The range of radio frequencies used by IEEE 802.11b/g/n wireless devices is called a channel. Select a channel from the drop-down list box.
Beacon Interval	The Beacon Interval value indicates the frequency interval of the beacon. Enter a value between 20 and 1000. A beacon is

	a packet broadcast by the Router to synchronize the wireless network.
RTS/CTS Threshold	The RTS (Request To Send) threshold (number of bytes) for enabling RTS/CTS handshake. Data with its frame size larger than this value will perform the RTS/CTS handshake. Setting this attribute to be larger than the maximum MSDU (MAC service data unit) size turns off the RTS/CTS handshake. Setting this attribute to zero turns on the RTS/CTS handshake. Enter a value between 1500 and 2347.
Fragmentation Threshold	The threshold (number of bytes) for the fragmentation boundary for directed messages. It is the maximum data fragment size that can be sent. Enter a value between 256 and 2346.
DTIM	This value, between 1 and 255, indicates the interval of the Delivery Traffic Indication Message (DTIM).
Wireless Mode	The default setting is 802.11b+g+n (Mixed mode). If you do not know or have both 11g and 11b devices in your network, then keep the default in mixed mode . From the drop-down manual, you can select 802.11g if you have only 11g card. If you have only 11b card, then select 802.11b and if you only have 802.11n then select 802.11n .

11n Settings

Label	Description
Channel Bandwidth	Select either 20 MHz or 20/40 MHz for the channel bandwidth. The higher the bandwidth the better the performance will be.
Guard Interval:	Select either 400nsec or 800nsec for the guard interval. The guard interval is here to ensure that data transmission do not interfere with each other, it also prevents propagation delays, echoing and reflections.
MCS	There are options 0~15 and AUTO to select for the Modulation and Coding Scheme . We recommend users selecting AUTO .

SSIDs Settings

Label	Description
SSID Index	Default SSID index is "1".
Broadcast SSSID	The SSID is the unique name of a wireless access point (AP) to be distinguished from another. For security propose, change the default wlan-ap to a unique ID name to the AP which is already built-in to the router's wireless interface. It is case sensitive and must not excess 32 characters. Make sure your

	wireless clients have exactly the SSID as the device, in order to get connected to your network.
WMM	In order to increase the performance of Multimedia data, please select Enable .
WPS	Select Yes in order to use WPS.

WPS Settings

Label	Description
WPS State	Displays whether the WPS is configured or unconfigured .
WPS Mode	Select the mode which to start WPS, choose between PIN Code or PBC (Push Button). Selecting Pin Code mode will require you to know the enrollee PIN code.
SSSID	Type in the Service Set Identifier name, it is the unique name of a wireless access point (AP) to be distinguished from another.
Authentication Type	To prevent unauthorized wireless stations from accessing data transmitted over the network, the router offers highly secure data encryption, known as WEP.&WPA. If you require high security for transmissions, there are two alternatives to select from: 64-bit WEP and 128-bit WEP. WEP 128 will offer increased security over WEP 64. You can disable or enable with WPA or WEP for protecting wireless network. The default type of wireless is disabled and to allow all wireless computers to communicate with the access points without any data encryption.

The range of radio frequencies used by IEEE 802.11g wireless devices is called a “channel”. Channels available depend on your geographical area. You may have a choice of channels (for your region) so you should use a different channel than an adjacent AP (access point) to reduce interference. Interference occurs when radio signals from different access points overlap causing interference and degrading performance.

Adjacent channels partially overlap however. To avoid interference due to overlap, your AP should be on a channel at least five channels away from a channel that an adjacent AP is using. For example, if your region has 11 channels and an adjacent AP is using channel 1, then you need to select a channel between 6 or 11.

Authentication Type

Label	Description
Disabled	To disable the WPA/WEP security.
WEP-64bits or WEP-128bits	<p>Enter the key to encrypt wireless data. To allow encrypted data transmission, the WEP Encryption Key values on all wireless stations must be the same as the router. There are four keys for your selection. The input format is in HEX style, 5 and 13 HEX codes are required for 64-bitWEP and 128-bitWEP respectively.</p> <p>If you chose WEP 64-bits, then enter any 5 ASCII characters or 10 hexadecimal characters ("0-9", "A-F").</p> <p>If you chose WEP 128-bits, then enter 13 ASCII characters or 26 hexadecimal characters ("0-9", "A-F").</p> <p>You must configure all four keys, but only one key can be activated at any one time. The default key is key 1.</p> <div data-bbox="268 622 1002 861" style="border: 1px solid #ccc; padding: 5px;"> <p>WEP 64-bits Please enter exactly 5 characters or 10 hexadecimal digits ("0-9", "A-F") preceded by 0x for each Key(1-4).</p> <p>WEP 128-bits Please enter exactly 13 characters or 26 hexadecimal digits ("0-9", "A-F") preceded by 0x for each Key(1-4).</p> <p><input checked="" type="radio"/> Key #1 : <input type="text" value="0x00000000000000000000000000000000"/></p> <p><input type="radio"/> Key #2 : <input type="text" value="0x00000000000000000000000000000000"/></p> <p><input type="radio"/> Key #3 : <input type="text" value="0x00000000000000000000000000000000"/></p> <p><input type="radio"/> Key #4 : <input type="text" value="0x00000000000000000000000000000000"/></p> </div>
WPA-PSK	<p>Wi-Fi Protected Access (WPA) is the newest and best available standard in Wi-Fi security. Two modes are available: Pre-Shared Key and RADIUS. Pre-Shared Key gives you a choice of two encryption methods: TKIP (Temporal Key Integrity Protocol), which utilizes a stronger encryption method and incorporates Message Integrity Code (MIC) to provide protection against hackers, and AES (Advanced Encryption System), which utilizes a symmetric 128-Bit block data encryption.</p> <p>Encryption: TKIP (Temporal Key Integrity Protocol) utilizes a stronger encryption method and incorporates Message Integrity Code (MIC) to provide protection against hackers.</p> <p>Pre-Shared key: The key for network authentication. The input format is in character style and key size should be in the range between 8 and 64 characters.</p> <div data-bbox="268 1380 1013 1484" style="border: 1px solid #ccc; padding: 5px;"> <p>Encryption : <input type="text" value="TKIP"/> ▼</p> <p>Pre-Shared Key : <input type="text" value=""/> (8~64 characters)</p> </div>

Wireless MAC Address Filter

The MAC filter screen allows you to configure the router to give exclusive access to up to 32 devices (Allow Association) or exclude up to 32 devices from accessing the router (Deny Association). Every Ethernet device has a unique MAC (Media Access Control) address.

The MAC address is assigned at the factory and consists of six pairs of hexadecimal characters, for example, 00:AA:BB:00:00:02. You need to know the MAC address of the devices to configure this screen.

To change your router's MAC filter settings, click Wireless LAN, MAC Filter to open the MAC Filter screen. The screen appears as shown.

Label	Description
Activated/Deactivated	Select Activated to enable MAC address filtering.
Action	Define the filter action for the list of MAC addresses in the MAC address filter table. Select Deny Association to block access to the router, MAC addresses not listed will be allowed to access the router. Select Allow Association to permit access to the router, MAC addresses not listed will be denied access to the router.
MAC Address	Enter the MAC addresses (in XX:XX:XX:XX:XX:XX format) of the wireless station that are allowed or denied access to the router in these address fields.

CHAPTER 6: WAN Setup

This chapter describes how to configure WAN settings.

6.1 WAN Overview

A WAN (Wide Area Network) is an outside connection to another network or the Internet.

See the Wizard Setup chapter for more information on the fields in the WAN screens.

6.2 PPPoE Encapsulation

The ADSL Router supports PPPoE (Point-to-Point Protocol over Ethernet). PPPoE is an IETF Draft standard (RFC 2516) specifying how a personal computer (PC) interacts with a broadband modem (DSL, cable, wireless, etc.) connection. The PPPoE option is for a dial-up connection using PPPoE.

For the service provider, PPPoE offers an access and authentication method that works with existing access control systems (for example Radius). PPPoE provides a login and authentication method that the existing Microsoft Dial-Up Networking software can activate, and therefore requires no new learning or procedures for Windows users.

One of the benefits of PPPoE is the ability to let you access one of multiple network services, a function known as dynamic service selection. This enables the service provider to easily create and offer new IP services for individuals.

Operationally, PPPoE saves significant effort for both you and the ISP or carrier, as it requires no specific configuration of the broadband modem at the customer site.

By implementing PPPoE directly on the ADSL Router (rather than individual computers), the computers on the LAN do not need PPPoE software installed, since the ADSL Router does that part of the task. Furthermore, with NAT, all of the LANs' computers will have access.

6.3 PPTP Encapsulation

Point-to-Point Tunneling Protocol (PPTP) is a network protocol that enables secure transfer of data from a remote client to a private server, creating a Virtual Private Network (VPN) using TCP/IP-based networks.

PPTP supports on-demand, multi-protocol and virtual private networking over public networks, such as the Internet.

6.4 Traffic Shaping

Traffic Shaping is an agreement between the carrier and the subscriber to regulate the average rate and “burstiness” or fluctuation of data transmission over

an ATM network. This agreement helps eliminate congestion, which is important for transmission of real time data such as audio and video connections.

Peak Cell Rate (PCR) is the maximum rate at which the sender can send cells. This parameter may be lower (but not higher) than the maximum line speed. 1 ATM cell is 53 bytes (424 bits), so a maximum speed of 832 Kbps gives a maximum PCR of 1962 cells/sec. This rate is not guaranteed because it is dependent on the line speed.

Sustained Cell Rate (SCR) is the mean cell rate of a bursty, on-off traffic source that can be sent at the peak rate, and a parameter for burst-type traffic. SCR may not be greater than the PCR; the system default is 0 cells/sec.

Maximum Burst Size (MBS) is the maximum number of cells that can be sent at the PCR. After MBS is reached, cell rates fall below SCR until cell rate averages to the SCR again. At this time, more cells (up to the MBS) can be sent at the PCR again. The following figure illustrates the relationship between PCR, SCR and MBS.

6.5 Configuring WAN Setup

To change the ADSL Router's WAN remote node settings, click **Interface Setup** then **Internet**. The screen differs by the encapsulation.

ATM VC	
Virtual Circuit ID	VPI (Virtual Path Identifier) and VCI (Virtual Channel Identifier) define a virtual circuit.
Status	Activated or Deactivated
VPI	The valid range for the VPI is 0 to 255. Enter the VPI assigned to you. This field may already be configured.
VCI	The valid range for the VCI is 32 to 65535. Enter the VCI assigned to you. This field may already be configured.
ATM QoS Type	Select CBR (Continuous Bit Rate) to specify fixed (always-on) bandwidth for voice or data traffic. Select UBR (Unspecified Bit Rate) for applications that are non-time sensitive, such as e-mail. Select VBR (Variable Bit Rate) for bursty traffic and bandwidth sharing with other applications. VBR is not available on all models.
Cell Rate	Cell rate configuration often helps eliminate traffic congestion that slows transmission of real time data such as audio and video connections.
Peak Cell Rate	Divide the DSL line rate (bps) by 424 (the size of an ATM cell) to find the Peak Cell Rate (PCR). This is the maximum rate at which the sender can send cells. Type the PCR here.
Sustain Cell Rate	The Sustain Cell Rate (SCR) sets the average cell rate (long-term) that can be transmitted. Type the SCR, which must be less than the PCR.
Maximum Burst Size	Maximum Burst Size (MBS) refers to the maximum number of cells that can be sent at the peak rate. Type the MBS, which is less than 65535.

ENCAPSULATION

Encapsulation	Select the method of encapsulation used by your ISP from the drop-down list box.
----------------------	--

PPPoA/PPPoE

Service Name	(PPPoE only) Type the name of your PPPoE service here.
User Name	Enter the user name exactly as your ISP assigned. If assigned a name in the form user@domain where domain identifies a service name, then enter both components exactly as given.
Password	A static IP address is a fixed IP that your ISP gives you. A dynamic IP address is not fixed; the ISP assigns you a different one each time you connect to the Internet. The Single User Account feature can be used with either a dynamic or static IP address.

	Select Obtain an IP Address Automatically if you have a dynamic IP address; otherwise select Static IP Address and type your ISP assigned IP address in the IP Address field below.
Multiplex	Select the method of multiplexing used by your ISP from the drop-down list. Choices are VC or LLC.

Connection Settings

Always ON	Select Always ON Connection when you want your connection up all the time. The ADSL Router will try to bring up the connection automatically if it is disconnected.
Connect on Demand	Connect on demand is dependent on the traffic. If there is no traffic (or Idle) for a pre-specified period of time), the connect will tear down automatically. And once there is traffic send or receive, the connection will be automatically on. Please insert the Idle Time in minute.

IP Address

Get IP Address	The IP address can be either dynamically (via DHCP) or given IP address provide by your ISP. For Static IP, you need to specify the IP address, Subnet Mask and Gateway IP address.
IP Address	You must specify a Router IP address.
IP Subnet Mask	Enter a subnet mask in dotted decimal notation. Refer to the Subnetting appendix in the to calculate a subnet mask If you are implementing subnetting.
Gateway	You must specify a gateway IP address.
NAT	Select this option to Activate/Deactivated the NAT (Network Address Translation) function for this VC. The NAT function can be activated or deactivated per PVC basis.
Default Route	if enable this function, the current PVC will be the default gateway to internet from this device.
Dynamic Route	RIP (Routing Information protocol) Select this option to specify the RIP version, including RIP-1 , RIP-2M and RIP-2B . RIP-2M and RIP-2B are both sent in RIP-2 format; the difference is that RIP-2M using Multicast and RIP-2 using Broadcast format.
Direction	RIP Direction Select this option to specify the RIP direction. None is for disabling the RIP function. Both means the ADSL Router will periodically send routing information and accept routing information then incorporate into routing table. IN only means the ADLS router will only accept but will not send RIP packet. OUT only means the ADLS router will only send but will not accept RIP packet.
Multicast	IGMP (Internet Group Multicast Protocol) is a session-layer protocol used to establish membership in a multicast group. The ADSL ATU-R supports both IGMP version 1 (IGMP-v1) and

	IGMP-v2. Select None to disable it.
Save	Click Apply to save the changes.

CHAPTER 7: Network Address Translation (NAT)

This chapter discusses how to configure NAT on the WebShare Wireless Router ADSL2+.

7.1 NAT Overview

NAT (Network Address Translation - NAT, RFC 1631) is the translation of the IP address of a host in a packet, for example, the source address of an outgoing packet, used within one network to a different IP address known within another network.

7.1.1 NAT Definitions

Inside/outside denotes where a host is located relative to the ADSL Router, for example, the computers of your subscribers are the inside hosts, while the web servers on the Internet are the outside hosts.

Global/local denotes the IP address of a host in a packet as the packet traverses a router, for example, the local address refers to the IP address of a host when the packet is in the local network, while the global address refers to the IP address of the host when the same packet is traveling in the WAN side.

Note that inside/outside refers to the location of a host, while global/local refers to the IP address of a host used in a packet. Thus, an inside local address (ILA) is the IP address of an inside host in a packet when the packet is still in the local network, while an inside global address (IGA) is the IP address of the same inside host when the packet is on the WAN side. The following table summarizes this information.

Item	Description
Inside	This refers to the host on the LAN.
Outside	This refers to the host on the WAN.
Local	This refers to the packet address (source or destination) as the packet travels on the LAN.
Global	This refers to the packet address (source or destination) as the packet travels on the WAN.

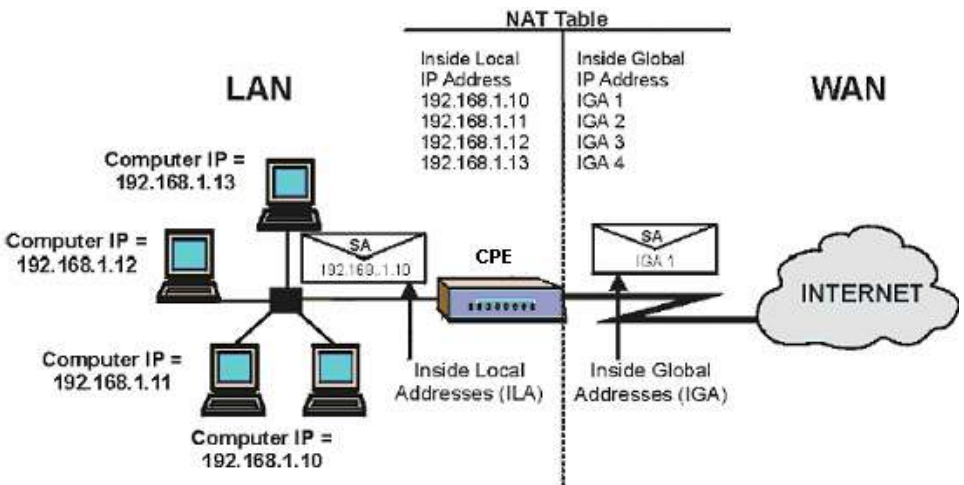

7.1.2 What NAT Does

In the simplest form, NAT changes the source IP address in a packet received

from a subscriber (the inside local address) to another (the inside global address) before forwarding the packet to the WAN side. When the response comes back, NAT translates the destination address (the inside global address) back to the inside local address before forwarding it to the original inside host. Note that the IP address (either local or global) of an outside host is never changed. The global IP addresses for the inside hosts can be either static or dynamically assigned by the ISP. In addition, you can designate servers, for example, a web server and a telnet server, on your local network and make them accessible to the outside world. With no servers defined, the ADSL Router filters out all incoming inquiries, thus preventing intruders from probing your network. For more information on IP address translation, refer to RFC 1631, The IP Network Address Translator (NAT).

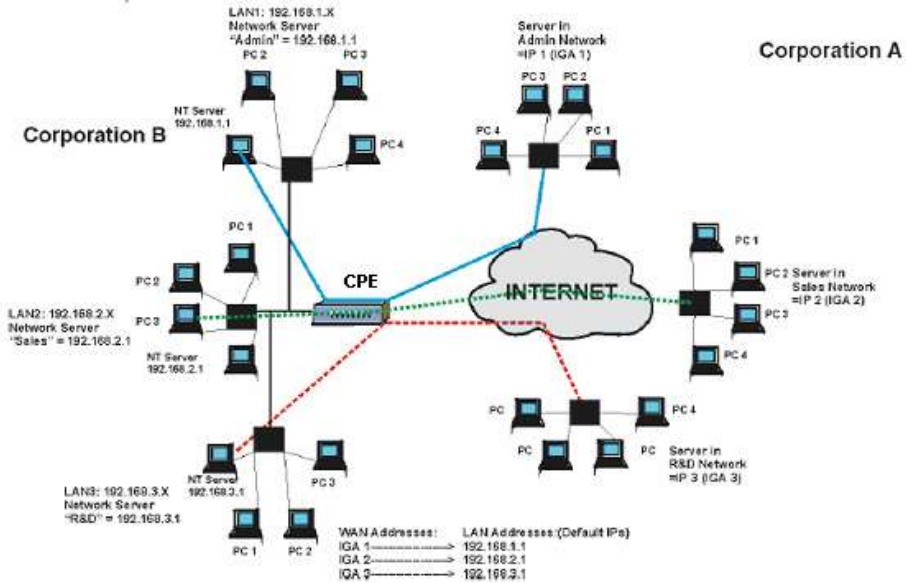

7.1.3 How NAT Works

Each packet has two addresses – a source address and a destination address. For outgoing packets, the ILA (Inside Local Address) is the source address on the LAN, and the IGA (Inside Global Address) is the source address on the WAN. For incoming packets, the ILA is the destination address on the LAN, and the IGA is the destination address on the WAN. NAT maps private (local) IP addresses to globally unique ones required for communication with hosts on other networks. It replaces the original IP source address (and TCP or UDP source port numbers for Many-to-One and Many-to-Many Overload NAT mapping) in each packet and then forwards it to the Internet. The ADSL Router keeps track of the original addresses and port numbers so incoming reply packets can have their original values restored. The following figure illustrates this.

7.1.4 NAT Application

The following figure illustrates a possible NAT application, where three inside LANs (logical LANs using IP Alias) behind the ADSL Router can communicate with three distinct WAN networks. More examples follow at the end of this chapter.

7.1.5 NAT Mapping Types

NAT supports five types of IP/port mapping. They are:

1. **One to One:** In One-to-One mode, the ADSL Router maps one local IP address to one global IP address.
2. **Many to One:** In Many-to-One mode, the ADSL Router maps multiple local IP addresses to one global IP address.
3. **Many to Many Overload:** In Many-to-Many Overload mode, the ADSL Router maps the multiple local IP addresses to shared global IP addresses.
4. **Many-to-Many No Overload:** In Many-to-Many No Overload mode, the ADSL Router maps each local IP address to a unique global IP address.
5. **Server:** This type allows you to specify inside servers of different services behind the NAT to be accessible to the outside world.

The following table summarizes these types.

Type	IP Mapping
One-to-One	ILA1 IGA1
Many-to-One (SUA/PAT)	ILA1 IGA1 ILA2 IGA1

	...
Many-to-Many Overload	ILA1 IGA1 ILA2 IGA2 ILA3 IGA1 ILA4 IGA2 ...
Many-to-Many No Overload	ILA1 IGA1 ILA2 IGA2 ILA3 IGA3 ...
Server	Server 1 IP IGA1 Server 2 IP IGA1 Server 3 IP IGA1

7.2 SUA (Single User Account) Versus NAT

SUA (Single User Account) is a implementation of a subset of NAT that supports two types of mapping, Many-to-One and Server. The ADSL Router also supports Full Feature NAT to map multiple global IP addresses to multiple private LAN IP addresses of clients or servers using mapping types as outlined in

7.3 Virtual Server and DMZ

A Virtual server set is a list of inside (behind NAT on the LAN) servers, for example, web or FTP, that you can make visible to the outside world even though SUA makes your whole inside network appear as a single computer to the outside world.

You may enter a single port number or a range of port numbers to be forwarded, and the local IP address of the desired server. The port number identifies a service; for example, web service is on port 80 and FTP on port 21. In some cases, such as for unknown services or where one server can support more than one service (for example both FTP and web service), it might be better to specify a range of port numbers. You can allocate a server IP address that corresponds to a port or a range of ports.

Many residential broadband ISP accounts do not allow you to run any server processes (such as a Web or FTP server) from your location. Your ISP may periodically check for servers and may suspend your account if it discovers any active services at your location. If you are unsure, refer to your ISP.

Default Server IP Address

In addition to the servers for specified services, NAT supports a default server IP address. A default server receives packets from ports that are not specified in this screen.

7.3.1 Port Forwarding: Services and Port Numbers

A NAT server set is a list of inside (behind NAT on the LAN) servers, for example, web or FTP, that you can make accessible to the outside world even though NAT makes your whole inside network appear as a single machine to the outside world.

Use the SUA Server page to forward incoming service requests to the server(s) on your local network. You may enter a single port number or a range of port numbers to be forwarded, and the local IP address of the desired server. The port number identifies a service; for example, web service is on port 80 and FTP on port 21. In some cases, such as for unknown services or where one server can support more than one service (for example both FTP and web service), it might be better to specify a range of port numbers.

In addition to the servers for specified services, NAT supports a default server. A service request that does not have a server explicitly designated for it is forwarded to the default server. If the default is not defined, the service request is simply discarded.

The most often used port numbers are shown in the following table. Please refer to RFC 1700 for further information about port numbers.

Services	Port Number/Protocol
File Transfer Protocol (FTP) Data	20/tcp
FTP Commands	21/tcp
Telnet	23/tcp
Simple Mail Transfer Protocol (SMTP) Email	25/tcp
Domain Name Server (DNS)	53/tcp and 53/udp
Trivial File Transfer Protocol (TFTP)	69/udp
finger	79/tcp
World Wide Web (HTTP)	80/tcp
POP3 Email	110/tcp
SUN Remote Procedure Call (RPC)	111/udp
Network News Transfer Protocol (NNTP)	119/tcp
Network Time Protocol (NTP)	123/tcp and 123/udp
News	144/tcp
Simple Management Network Protocol (SNMP)	161/udp
SNMP (traps)	162/udp
Border Gateway Protocol (BGP)	179/tcp
Secure HTTP (HTTPS)	443/tcp
rlogin	513/tcp
rexec	514/tcp
talk	517/tcp and 517/udp

ntalk	518/tcp and 518/udp
Open Windows	2000/tcp and 2000/udp
Network File System (NFS)	2049/tcp
X11	6000/tcp and 6000/udp
Routing Information Protocol (RIP)	520/udp
Layer 2 Tunnelling Protocol (L2TP)	1701/udp

7.3.2 Virtual Server

Click on **Advanced Setup** then **NAT**.

Click on **Virtual Server**.

The following table describes the labels in this screen.

Label	Description
Start Port No.	Enter a port number in this field. To forward only one port, enter the port number again in the End Port No. field. To forward a series of ports, enter the start port number here and the end port number in the End Port No. field.
End Port No.	Enter a port number in this field. To forward only one port, enter the port number again in the Start Port No. field above and then enter it again in this field. To forward a series of ports, enter the last port number in a series that begins with the port number in the Start Port No. field above.
IP Address	Enter your server IP address in this field.

Let's say you want to assign ports 22-25 to one server, port 80 to another and assign a default server IP address of 192.168.1.35 as shown in the next figure.

The NAT network appears as a single host on the Internet

7.4 Selecting the NAT Mode

Click **Advanced Setup** then **NAT** to open the following screen chose **Multiple (Numbers of IP)**.

Virtual Circuit: PVC0

NAT Status: Activated

Number of IPs: Single Multiple

- DMZ
- Virtual Server
- IP Address Mapping (for Multiple IPs Service)

SAVE

Click on **IP Address Mapping** (for Multiple IPs Service).

Address Mapping Rule: PVC0

Rule Index: 1

Rule Type: One-to-One

Local Start IP: 0.0.0.0 (for all local Ips, enter 0.0.0.0 for Start IP)

Local End IP: N/A (for all local Ips, enter 255.255.255.255 for End IP)

Public Start IP: 0.0.0.0 (0.0.0.0 for Dynamic IP)

Public End IP: N/A

Address Mapping List

Rule	Type	Local Start IP	Local End IP	Public Start IP	Public End IP
1	-	0.0.0.0	...	0.0.0.0	...

6	-	0.0.0.0	...	0.0.0.0	...
7	-	0.0.0.0	...	0.0.0.0	...
8	-	0.0.0.0	...	0.0.0.0	...

SAVE DELETE BACK CANCEL

Ordering your rules is important because the ADSL Router applies the rules in the order that you specify. When a rule matches the current packet, the ADSL Router takes the corresponding action and the remaining rules are ignored. If there are any empty rules before your new configured rule, your configured rule will be pushed up by that number of empty rules. For example, if you have already configured rules 1 to 6 in your current set and now you configure rule number 9. In the set summary screen, the new rule will be rule 7, not 9. Now if you delete rule 4, rules 5 to 7 will be pushed up by 1 rule, so old rules 5, 6 and 7 become new rules 4, 5 and 6.

To change the ADSL Router's address mapping settings.

The following table describes the labels in this screen.

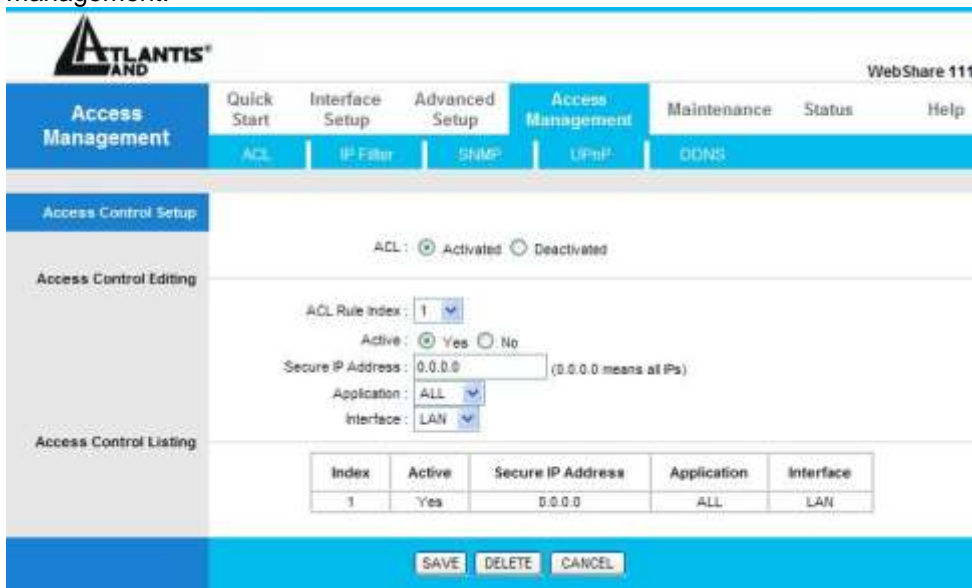

Label	Description
Rule Index	Chose the number
Rule Type	1-1: One-to-one mode maps one local IP address to one global IP address. Note that port numbers do not change for the One-to-one NAT mapping type. M-1: Many-to-One mode maps multiple local IP addresses to one global IP address. M-M Ov (Overload): Many-to-Many Overload mode maps multiple local IP addresses to shared global IP addresses. MM No (No Overload): Many-to-Many No Overload mode maps each local IP address to unique global IP addresses. Server(available on next release of firmware): This type allows you to specify inside servers of different services behind the NAT to be accessible to the outside world.
Local Start IP	This is the starting Inside Local IP Address (ILA). Local IP addresses are N/A for Server port mapping.
Local End IP	This is the end Inside Local IP Address (ILA). If your rule is for all local IP addresses, then enter 0.0.0.0 as the Local Start IP address and 255.255.255.255 as the Local End IP address. This field is N/A for One-to-one and Server mapping types.
Public Start IP	This is the starting Inside Global IP Address (IGA). Enter 0.0.0.0 here if you have a dynamic IP address from your ISP. You can only do this for Many-to-One and Server mapping types.
Public End IP	This is the ending Inside Global IP Address (IGA). This field is N/A for One-to-one, Many-to-One and Server mapping types.

CHAPTER 8: Access Management

8.1 ACL

Access Control Listing allows you to determine which services/protocols can access which WEBSHARE Wireless N ADSL2+ Router interface from which computers.

You can configure the router for remote Telnet access or upload and download router firmware and configuration files using FTP. To use this feature, your computer must have an FTP client. And can use the WEBSHARE Wireless N ADSL2+ Router embedded web configurator for configuration and file management.

ACL: Activated Deactivated

ACL Rule Index: 1

Active: Yes No

Secure IP Address: 0.0.0.0 (0.0.0.0 means all IPs)

Application: ALL

Interface: LAN

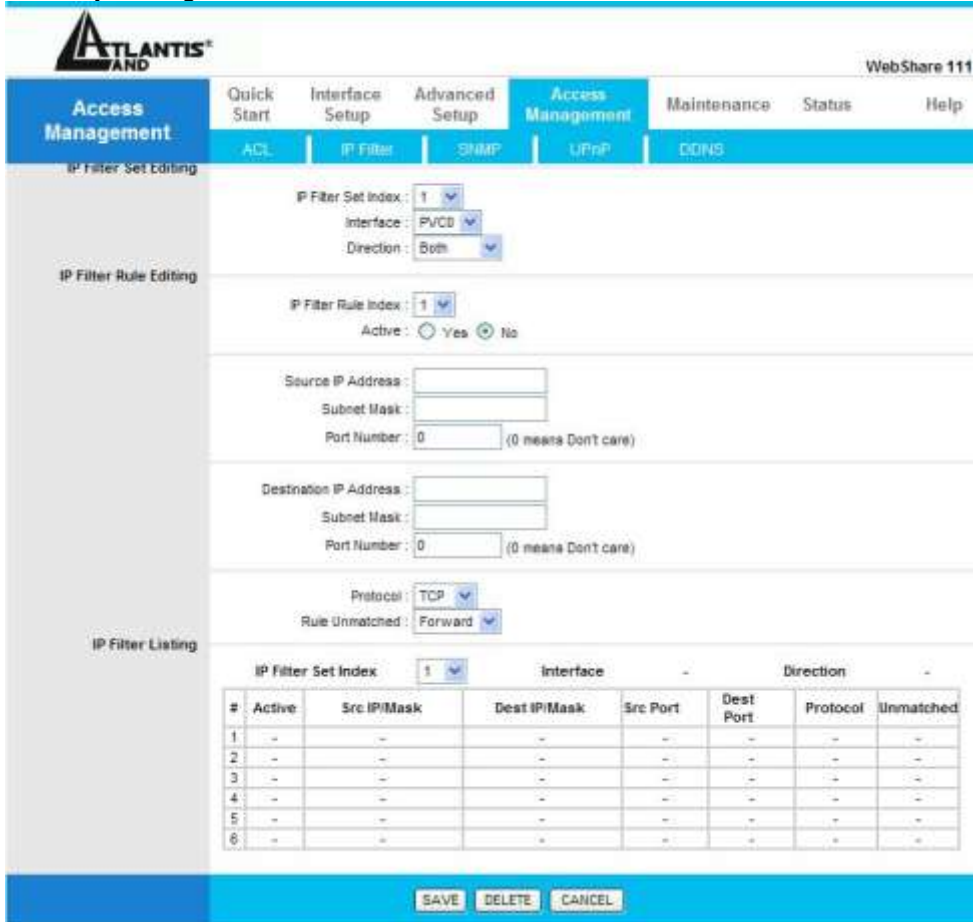

Index	Active	Secure IP Address	Application	Interface
1	Yes	0.0.0.0	ALL	LAN

SAVE DELETE CANCEL

Field	Meaning
ACL Rule Index	This is item number
Secure IP Address	The default 0.0.0.0 allows any client to use this service to remotely manage the WEBSHARE Wireless N ADSL2+ Router. Type an IP address to restrict access to a client with a matching IP address
Application	Choose a service that you may use to remotely manage the WEBSHARE Wireless ROUTER ADSL2+.
Interface	Select the access interface. Choices are LAN , WAN and Both

8.2 IP Filter

You may use telnet or Web to remotely manage the ADSL Router. User just needs to enable Telnet or Web and give it an IP address that want to access the ADSL Router. The default IP 0.0.0.0 allows any client to use this service to remotely manage the ADSL Router.

IP FILTER SET EDITING:

Field	Meaning
Ip Filter Set Index	This is item number
Interface	Select which channel (PVC) to configure

Direction	Select the access to the Internet (“Outgoing”) or from the Internet (“Incoming”).or Both
------------------	--

IP FILTER RULE EDITING:

Field	Meaning
Ip Filter Rule Index	This is item number
Active	Select Yes from the drop down list box to enable IP filter rule
Source IP Address	The source IP address or range of packets to be monitored
Subnet Mask	It is the destination IP addresses based on above destination subnet IP
Source Port Number	This Port or Port Ranges defines the port allowed to be used by the Remote/WAN to connect to the application. Default is set from range 0 ~ 65535. It is recommended that this option be configured by an advanced user
Destination IP Address	This is the destination subnet IP address
Subnet Mask	It is the destination IP addresses based on above destination subnet IP
Protocol	It is the packet protocol type used by the application, select either TCP or UDP or ICMP
Rule Unmatched	Select action for the traffic unmatching current rule; Forward to leave it pass through, and NEXT to check it by the next rule

IP FILTER LIST:

Field	Meaning
#	Item number
Active	Whether the connection is currently activ
Source IP Mask	The source IP address or range of packets to be monitored
Destination IP Mask	This is the destination subnet IP address
Source port	This Port or Port Ranges defines the port allowed to be used by the Remote/WAN to connect to the application. Default is set from range 0 ~ 65535 . It is recommended that this option be configured by an advanced user
Destination Port	This is the Port or Port Ranges that defines the application

Protocol	It is the packet protocol type used by the application, select either TCP or UDP or ICMP
-----------------	---

8.3 SNMP

Simple Network Management Protocol (SNMP) is a protocol used for exchanging management information between network devices. SNMP is a member of the TCP/IP protocol suite. WebShare Wireless N ADSL2+ Router supports SNMP agent functionality which allows a manager station to manage and monitor the router through the network.

Field	Meaning
Get Community	Type the Get Community, which is the password for the incoming Get-and GetNext requests from the management station
Set Community	Type the Set Community, which is the password for incoming Set requests from the management station

8.4 UPnP

UPnP offers peer-to-peer network connectivity for PCs and other network devices, along with control and data transfer between devices. UPnP offers many advantages for users running NAT routers through UPnP NAT Traversal, and on supported systems makes tasks such as port forwarding much easier by letting the application control the required settings, removing the need for the user to control advanced configuration of their device.

Both the user's Operating System and the relevant application must support UPnP in addition to the router. Windows XP and Windows Me natively support UPnP (when the component is installed), and Windows 98 users may install the Internet Connection Sharing client from Windows XP in order to support UPnP. Windows 2000 does not support UPnP.

Field	Meaning
UPnP	Select this checkbox to activate UPnP. Be aware that anyone could use a UPnP application to open the web configurator's login screen without entering the WEBSHARE Wireless N ADSL2+ Router IP address
Auto-Configured	Select this check box to allow UPnP-enabled applications to automatically configure the WEBSHARE Wireless N ADSL2+ Router so that they can communicate through the WEBSHARE Wireless N ADSL2+ Router, for example by using NAT traversal, UPnP applications automatically reserve a NAT forwarding port in order to communicate with another UPnP enabled device; this eliminates the need to manually configure port forwarding for the UPnP enabled application

8.5 DDNS

The Dynamic DNS function allows you to alias a dynamic IP address to a static hostname, allowing users whose ISP does not assign them a static IP address to use a domain name. This is especially useful for hosting servers via your ADSL connection, so that anyone wishing to connect to you may use your domain name, rather than having to use your dynamic IP address, which changes from time to time. This dynamic IP address is the WAN IP address of the router, which is assigned to you by your ISP.

You will first need to register and establish an account with the Dynamic DNS provider using their website, for example <http://www.dyndns.org/>

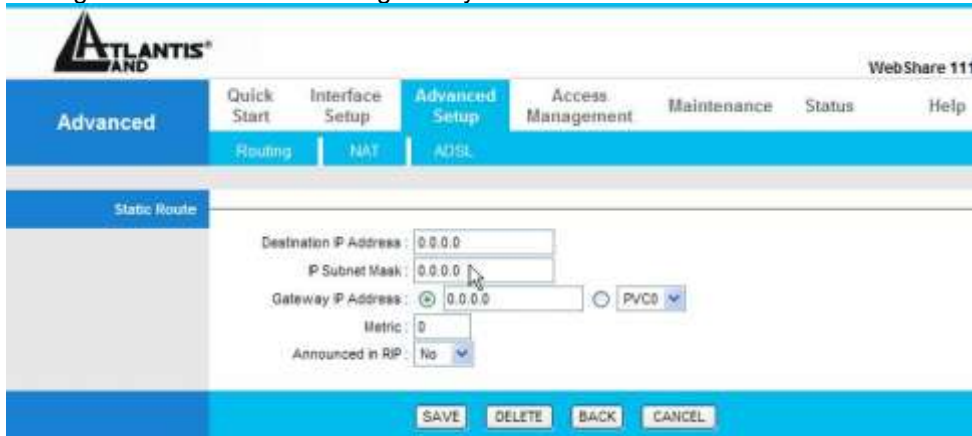

Field	Meaning
Dynamic DNS	Select this check box to use dynamic DNS
Service Provider	Select the name of your Dynamic DNS service provider
My Host Name	Type the domain name assigned to your WEBSHARE Wireless ROUTER ADSL2+ by your Dynamic DNS provider
E-Mail Address	Type your e-mail address
Username	Type your user name
Password	Type the password assigned to you
Wildcard support	Select this check box to enable DYNDNS Wildcard

CHAPTER 9: Advanced Setup

9.1 Routing

If you have another router with a LAN-to-LAN connection, you may create a static routing on the router that is the gateway to Internet.

ROUTING TABLE LIST:

Field	Meaning
#	Item number
Dest IP	IP address of the destination network
Mask	The destination mask address
Gateway IP	IP address of the gateway or existing interface that this route uses
Metric	It represents the cost of transmission for routing purposes. The number need not be precise, but it must be between 1 and 15
Device	Media/channel selected to append the route
Use	Counter for access times
Edit	Edit the route; this icon is not shown for system default route
Drop	Edit the route; this icon is not shown for system default route

9.1.1 Add Route

Field	IP	Meaning
Destination Address		This is the destination subnet IP address
IP Subnet Mask		It is the destination IP addresses based on above destination subnet IP
Gateway IP Address		This is the gateway IP address to which packets are to be forwarded
Metric		It represents the cost of transmission for routing purposes. The number need not be precise, but it must be between 1 and 15
Announced in RIP		This parameter determines if the Prestige will include the route to the remote node in its RIP broadcasts. Set "Yes", it is kept private and is not included in RIP broadcasts. Set "No", the remote node will be propagated to other hosts through RIP broadcasts

9.2 NAT

The NAT (Network Address Translation - NAT, RFC 1631) is the translation of the IP address of a host in a packet. The default setting is **Dynamic NAPT**. It provides dynamic Network Address Translation capability between LAN and multiple WAN connections, and the LAN traffic is routed to appropriate WAN connections based on the destination IP addresses and Route Table. This eliminates the need for the static NAT session configuration between multiple LAN clients and multiple WAN connections.

Field	Meaning
Virtual Circuit	VPI (Virtual Path Identifier) and VCI (Virtual Channel Identifier) define a virtual circuit. There are eight groups of PVC can be defined and used
Number of IPs	User can select Single or Multiple

9.2.2 DMZ

The DMZ Host is a local computer exposed to the Internet. When setting a particular internal IP address as the DMZ Host, all incoming packets will be checked by the Firewall and NAT algorithms then passed to the DMZ host, when a packet received does not use a port number used by any other Virtual Server entries.

Field	Meaning
DMZ	Disabled: As set in default setting, it disables the DMZ function. Enabled: It activates your DMZ function
DMZ Host Address	Give a static IP address to the DMZ Host when

Enabled radio button is checked. Be aware that this IP will be exposed to the WAN/Internet.

Select the **Apply** button to apply your changes.

9.2.3 Virtual Server

In TCP/IP and UDP networks a port is a 16-bit number used to identify which application program (usually a server) incoming connections should be delivered to. Some ports have numbers that are pre-assigned to them by the IANA (the Internet Assigned Numbers Authority), and these are referred to as “well-known ports”. Servers follow the well-known port assignments so clients can locate them.

If you wish to run a server on your network that can be accessed from the WAN (i.e. from other machines on the Internet that are outside your local network), or any application that can accept incoming connections (e.g. Peer-to-peer/P2P software such as instant messaging applications and P2P file-sharing applications) and are using NAT (Network Address Translation), then you will usually need to configure your router to forward these incoming connection attempts using specific ports to the PC on your network running the application. You will also need to use port forwarding if you want to host an online game server.

The reason for this is that when using NAT, your publicly accessible IP address will be used by and point to your router, which then needs to deliver all traffic to the private IP addresses used by your PCs. Please see the WAN configuration section of this manual for more information on NAT.

The device can be configured as a virtual server so that remote users accessing services such as Web or FTP services via the public (WAN) IP address can be automatically redirected to local servers in the LAN network. Depending on the requested service (TCP/UDP port number), the device redirects the external service request to the appropriate server within the LAN network.

Field	Meaning
Rule Index	Choose the rule number
Start Port Number	Enter a port number in this field
End Port Number	Enter a port number in this field
Local IP Address	Enter your server IP address in this field

9.2.4 IP Address Mapping

Field	Meaning
Rule Index	Choose the rule number
Rule Type	<p>One-to-one: This is the mode maps one local IP address to one global IP address. Note that port numbers do not change for the One-to-one NAT mapping type</p> <p>Many-to-One: This is the mode maps multiple local IP addresses to one global IP address. This is equivalent to Many to One (i.e., PAT, port address translation)</p> <p>Many-to-Many Overload: This is mode maps multiple local IP addresses to shared global IP addresses</p> <p>Many-to-Many No Overload: This is the mode maps each local IP address to unique global IP addresses</p> <p>Server: This type allows you to specify inside servers of different services behind the NAT to be accessible to the outside world</p>
Local Start IP	This is the starting Inside Local IP Address (ILA). Local IP addresses are N/A for Server port mapping
Local End IP	This is the end Inside Local IP Address (ILA). If your rule is for all local IP addresses, then enter 0.0.0.0 as the Local Start IP address and 255.255.255.255 as the Local End IP address. This field is N/A for One-to-one and Server mapping types
Public Start IP	This is the starting Inside Public IP Address. Enter 0.0.0.0 here if you have a dynamic IP address from your ISP
Public End IP	This is the ending Inside Public IP Address. This field is N/A for One-to-one, Many-to-One and Server mapping types

If you have disabled the NAT option in the WAN-ISP section, the Virtual Server function will hence be invalid.

If the DHCP server option is enabled, you have to be very careful in assigning the IP addresses of the virtual servers in order to avoid conflicts. The easiest way of configuring Virtual Servers is to manually assign static IP address to each virtual server PC, with an address that does not fall into the range of IP addresses that are to be issued by the DHCP server. You can configure the virtual server IP address manually, but it must still be in the same subnet as the router.

9.3 QoS

Quality of Service (QoS) helps to prioritize data as it enters your router. By attaching special identification marks or headers to incoming packets, QoS determines which queue the packets enter, based on priority. This is useful when there are certain types of data you want to give higher priority to, such as voice data packets given higher priority than Web data packets.

The main goal of QoS is prioritizing incoming data, preventing data loss due to factors such as jitter, delay and dropping. Another important aspect of QoS is ensuring that prioritizing one data flow doesn't interfere with other data flows.

QoS can be toggled Activated and Deactivated. QoS must be activated before you can edit the following options. When you are done making changes, click on **Add** to save your changes.

Click on **QoS Settings Summary** to view the list of QoS rules that have been added.

Quality of Service

QoS: Activated Deactivated

Summary: QoS Settings Summary

Rule

Rule Index: 1 ▼

Active: Activated Deactivated

Application: ▼

Physical Ports:	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
	WLAN	Enet1	Enet2	Enet3	Enet4

Destination MAC:

IP:

Mask:

Port Range: ~

Source MAC:

IP:

Mask:

Port Range: ~

Protocol ID: ▼

Vlan ID Range: ~

IPP/DS Field: IPP/TOS DSCP

IP Precedence Range: ~ ▼

Type of Service: ▼

DSCP Range: ~ (Value Range: 0 ~ 63)

802.1p: ~ ▼

Rule

You can set 16 different QoS rules. Each QoS rule has its detail setting conditions like: 802.1p,application, DSCP, IP, MAC, Protocol, TOS, VLAN...etc, you can modify the default value to any new one you wish. Please notice that only when the packet fulfill every detail setting conditions here, then this packet will be remarked as the priority queue of each rule. The non-selected setting part will be treated as “don’t care” and the system will not handle this setting part. If the original packet does not have 802.1q tagged header, system will not add header for this packet even the detail setting condition has adding 802.1p priority ability.

Field	Meaning
Rule Index	Select 16 different rules, each rule’s detail can be set and saved.
Active	Select QoS is activated or deactivated.
Application	Select 11 different applications: IGMP, SIP, H.323, MGCP, SNMP, DNS, DHCP, RIP, RSTP, RTCP, RTP.
Physical Ports	Once you select the application, the associated ports will be displayed.
Destination MAC	Set the Ethernet MAC value that you want to filter in destination side.
IP (Destination)	Set the IP address value that you want to filter in destination side.
Mask (Destination)	Set the subnet mask value that you want to filter in destination side.
Port Range	Set the port range value that you want to filter in destination side.
Source MAC	Set the Ethernet MAC value that you want to filter in source side.
IP (Source)	Set the IP address value that you want to filter in source side.
Mask (Source)	Set the subnet mask value that you want to filter in source side.
Port Range	Set the port range value that you want to filter in source side.
Protocol ID	Set the protocol ID type that you want to filter.
VLAN ID Range	Set the Vlan value that you want to filter.
IPP/DS Field	Select IP QoS format.
IP Precedence Range:	Select the IP precedence range.
Type of Service:	Select 5 different type of service.
DSCP Range	Set the DSCP value that you want to filter.
802.1p	Set the remarked new 802.1p priority value on the packet that fulfill every detail setting condition of each rule.

Action

After finishing all rules detail condition setting, select the rule you want to execute and action here.

Action	<p>IPP/DS Field : <input type="radio"/> IPP/TOS <input checked="" type="radio"/> DSCP</p> <p>IP Precedence Remarking : <input type="text"/></p> <p>Type of Service Remarking : <input type="text"/></p> <p>DSCP Remarking : <input type="text"/> (Value Range: 0 ~ 63)</p> <p>802.1p Remarking : <input type="text"/></p> <p>Queue # : <input type="text"/></p>
<input type="button" value="ADD"/> <input type="button" value="DELETE"/> <input type="button" value="CANCEL"/>	

Field	Meaning
IPP/DS Field	Select IP QoS format.
IP Precedence Remarking:	Select the remarking value of IP precedence.
Type of Service Remarking:	Select the remarking value of type of service.
DSCP Remarking	Select the remarking value of DSCP.
802.1p Remarking	Select the remarking value of 802.1p.
Queue	Select four types of Queue: Low, Medium, High, Highest.

9.4 ADSL

Field	Meaning
ADSL Mode	The default setting is Auto Sync-UP . This mode will automatically detect your ADSL, ADSL2+, ADSL2, G.dmt, G.lite, and T1.413. But in some area, multimode cannot detect the ADSL line code well. If it is the case, please adjust the ADSL line code to G.dmt or T1.413 first. If it still fails, please try the other values such as ALCTL, ADI, etc
ADSL Type	There are five modes “Open Annex Type and Follow DSLAM’s Setting”, “Annex A”, “Annex I”, “Annex A/L”, “Annex M” and “Annex A/I/L/M” that user can select for this connection

CHAPTER 10: Maintenance

10.1 Administration

In factory setting, the default password is **atlantis**, and that for user is also password. You can change the default password to ensure that someone cannot adjust your settings without your permission. Every time you change your password, please record the password and keep it at a safe place.

Field	Meaning
New Password	Type the new password in this field
Confirm Password	Type the new password again in this field

10.2 Time Zone

The router does not have a real time clock on board; instead, it uses the Simple Network Time Protocol (SNTP) to get the current time from an SNTP server outside your network. Choose your local time zone. After a successful connection to the Internet, the router will retrieve the correct local time from the SNTP server you have specified. If you prefer to specify an SNTP server other than those in the drop-down list, simply enter its IP address as shown above. Your ISP may provide an SNTP server for you to use.

Field	Meaning
Synchronize time with	Select the time service protocol that your time server sends when you turn on the Router
Time Zone	Choose the time zone of your location. This will set the time difference between your time zone and Greenwich Mean Time (GMT)
Daylight Saving	Select this option if you use daylight savings time
NTP Server Address	Enter the IP address of your time server. Check with your ISP/network administrator if you are unsure of this information

10.3 Firmware

Your router’s “firmware” is the software that allows it to operate and provides all its functionality. Think of your router as a dedicated computer, and the firmware as the software it runs. Over time this software may be improved and modified, and your router allows you to upgrade the software it runs to take advantage of these changes.

To upgrade the firmware of WEBSHARE Wireless N ADSL2+ Router, you should download or copy the firmware to your local environment first. Press the “**Browse...**” button to specify the path of the firmware file. Then, click “**Upgrade**” to start upgrading. When the procedure is completed, WEBSHARE Wireless N ADSL2+ Router will reset automatically to make the new firmware work.

Field	Meaning
New Location	Type in the location of the file you want to upload in this field or click Browse to find it
Browse	Click Browse... to find the .ras file you want to upload. Remember that you must decompress compressed (.zip) files before you can upload them
Upgrade	Click UPGRADE to begin the upload process. This process may take up to two minutes

After two minutes, log in again and check your new firmware version in the System Status screen.

If the upload was not successful, the following screen will appear. Click Back to go back to the Firmware screen.

Error Message:

ERROR: FAIL TO UPDATE DUE TO... The uploaded file was not accepted by the router.

Back

DO NOT power down the router or interrupt the firmware upgrading while it is still in process. Improper operation could damage the router.

10.4 SysRestart

Click **SysRestart** with option **Current Settings** to reboot your router (and restore your last saved configuration).

If you wish to restart the router using the factory default settings (for example, after a firmware upgrade or if you have saved an incorrect configuration), select **Factory Default Settings** to reset to factory default settings.

You may also reset your router to factory settings by holding the small Reset pinhole button on the back of your router in for 10-12 seconds whilst the router is turned on.

10.5 Diagnostic

The Diagnostic Test page shows the test results for the connectivity of the physical layer and protocol layer for both LAN and WAN sides.

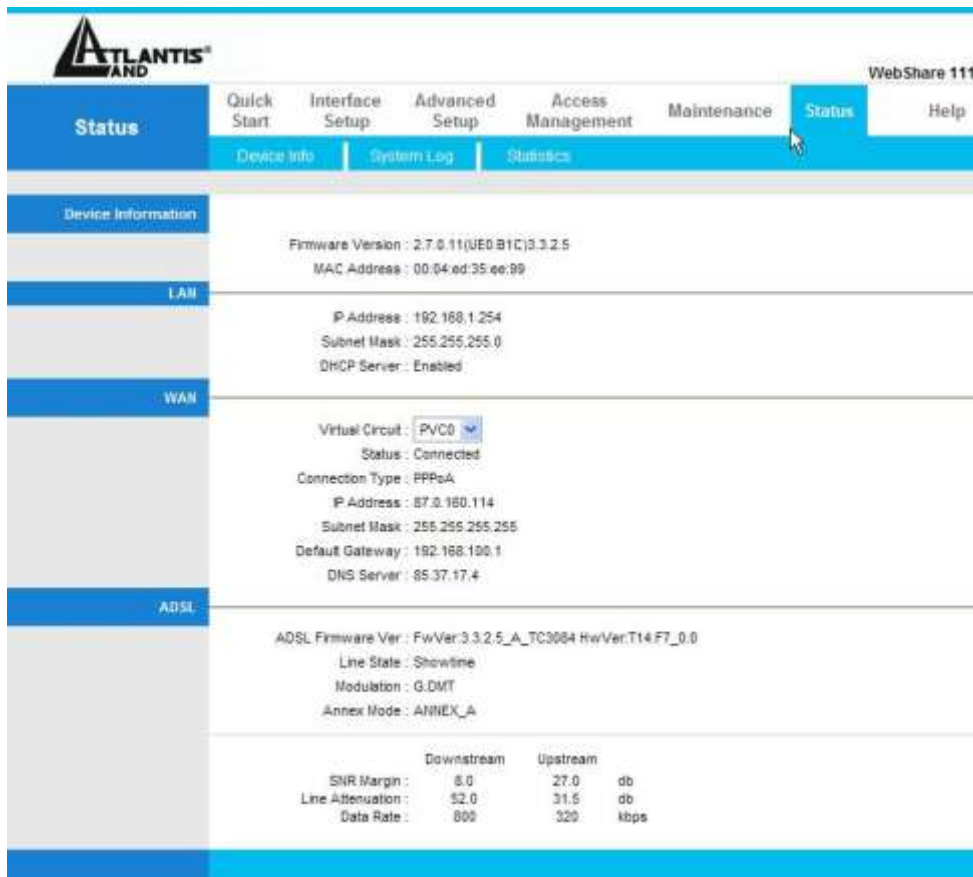

The screenshot shows the Atlantis WebShare 111 interface. At the top left is the Atlantis Brand logo. The main navigation bar includes 'Quick Start', 'Interface Setup', 'Advanced Setup', 'Access Management', 'Maintenance' (highlighted), 'Status', and 'Help'. Below this is a sub-menu with 'Administration', 'Time Zone', 'Firmware', 'SysRestart', and 'Diagnostics'. The 'Diagnostics' section is active, showing a 'Diagnostic Test' area. A dropdown menu for 'Virtual Circuit' is set to 'PVC0'. The test results are as follows:

Test Description	Result
>> Testing Ethernet LAN connection ...	PASS
>> Testing ADSL Synchronization ...	PASS
>> Testing ATM OAM segment ping ...	PASS
>> Testing ATM OAM end to end ping ...	PASS
>> Ping Primary Domain Name Server ...	FAIL
>> Ping www.yahoo.com ...	PASS

CHAPTER 11: Status

11.1 Device Info

Atlantis BAND WebShare 111

[Quick Start](#) |
 [Interface Setup](#) |
 [Advanced Setup](#) |
 [Access Management](#) |
 [Maintenance](#) |
 Status |
 [Help](#)

[Device Info](#) |
 [System Log](#) |
 [Statistics](#)

Device Information

Firmware Version : 2.7.0.11(JE0B1C)3.3.2.5
 MAC Address : 00:04:ed:35:ee:99

LAN

IP Address : 192.168.1.254
 Subnet Mask : 255.255.255.0
 DHCP Server : Enabled

WAN

Virtual Circuit : PVC0
 Status : Connected
 Connection Type : PPPoA
 IP Address : 87.0.160.114
 Subnet Mask : 255.255.255.255
 Default Gateway : 192.168.100.1
 DNS Server : 85.37.17.4

ADSL

ADSL Firmware Ver : FwVer:3.3.2.5_A_TC3084 HwVer:T14F7_0.0
 Line State : Showtime
 Modulation : G.DMT
 Annex Mode : ANNEX_A

	Downstream	Upstream	
SNR Margin :	6.0	27.0	db
Line Attenuation :	52.0	31.5	db
Data Rate :	800	320	kbps

DEVICE INFORMATION:

Field	Meaning
Firmware version	This is the Firmware version
MAC Address	This is the MAC Address

LAN:

Field	Meaning
-------	---------

IP Address	LAN port IP address
Sub Net Mask	LAN port IP subnet mask
DHCP Server	LAN port DHCP role - Enabled, Relay or disabled

WAN:

Field	Meaning
Status	“Not connected” or “Connected”
Virtual Circuit	There are eight groups of PVC can be defined VPI: The valid range for the VPI is 0 to 255 VCI: The valid range for the VCI is 32 to 65535
Connection Type	Name of the WAN connectio
VPI/VCI	Virtual Path Identifier and Virtual Channel Identifier
IP Address	WAN port IP address
Subnet Mask	WAN port IP subnet mask
Default Gateway	The IP address of the default gateway
DNS Server	WAN port DHCP role - Enabled, Relay or disabled

ADSL:

Field	Meaning
ADSL firmware ver	This is the DSL firmware version associated with your router
Line State	This is the status of your ADSL lin
Annex Mode	To show the router’s type, e.g. Annex A, Annex B
Max TX Power	This field displays the transmit output power level of the ADSL Router.

11.2 System Log

Display system logs accumulated up to the present time. You can trace historical information with this function.

11.3 Statistics

Read-only information here includes port status and packet specific statistics. Also provided are "Transmit Statistics" and "Receive Statistics".

**ETHERNET:**

Field	Meaning
Interface	This field displays the type of port
Transmit Frames	This field displays the number of frames transmitted in the last second
Transmit Multicast Frames	This field displays the number of multicast frames transmitted in the last second
Transmit total Bytes	This field displays the number of bytes transmitted in the last second
Transmit Collision	This is the number of collisions on this port
Transmit Error Frames	This field displays the number of error packets on this port
Receive Frames	This field displays the number of frames received in the last second
Receive Multicast Frames	This field displays the number of multicast frames received in the last second
Receive total Bytes	This field displays the number of bytes received in the last second
Receive CRC Errors	This field displays the number of error packets on this port
Receive Under-size Frames	This field displays the number of under-size frames received in the last second

ADSL:

Field	Meaning
Transmit total PDUs	This field displays the number of total PDU transmitted in the last second
Transmit total Error Counts	This field displays the number of total error transmitted in the last second
Receive total PDUs	This field displays the number of total PDU received in the last second
Receive total Error Counts	This field displays the number of total error received in the last second

APPENDIX A: Troubleshooting

This chapter covers potential problems and the corresponding remedies.

A.1 Using LEDs to Diagnose Problems

The LEDs are useful aides for finding possible problem causes.

A.1.1 Power LED

The PWR LED on the front panel does not light up.

STEPS	CORRECTIVE ACTION
1	Make sure that the ADSL Router's power adaptor is connected to the ADSL Router and plugged in to an appropriate power source. Use only the supplied power adaptor.
2	Check that the ADSL Router and the power source are both turned on and the ADSL Router is receiving sufficient power.
3	Turn the ADSL Router off and on.
4	If the error persists, you may have a hardware problem. In this case, you should contact your vendor.

A.1.2 LAN LED

The LAN LED on the front panel does not light up.

STEPS	CORRECTIVE ACTION
1	Check the Ethernet cable connections between the ADSL Router and the computer or hub.
2	Check for faulty Ethernet cables.
3	Make sure your computer's Ethernet card is working properly.
4	If these steps fail to correct the problem, contact your local distributor for assistance.

A.1.3 DSL LED

The DSL LED on the front panel does not light up.

STEPS	CORRECTIVE ACTION
1	Check the telephone wire and connections between the ADSL Router DSL port and the wall jack.
2	Make sure that the telephone company has checked your phone

	line and set it up for DSL service.
3	Reset your ADSL line to reinitialize your link to the DSLAM. For details, refer to the Maintenance chapter (web configurator) or the System Information and Diagnosis chapter.
4	If these steps fail to correct the problem, contact your local distributor for assistance.

A.2 Telnet

I cannot telnet into the ADSL Router.

STEPS	CORRECTIVE ACTION
1	Check the LAN port and the other Ethernet connections.
2	Make sure you are using the correct IP address of the ADSL Router. Check the IP address of the ADSL Router.
3	Ping the ADSL Router from your computer. If you cannot ping the ADSL Router, check the IP addresses of the ADSL Router and your computer. Make sure your computer is set to get a dynamic IP address; or if you want to use a static IP address on your computer, make sure that it is on the same subnet as the ADSL Router.
4	Make sure you entered the correct password. The default password is "admin". If you have forgot your username or password, refer to Section A.5.
5	If these steps fail to correct the problem, contact the distributor.

A.3 Web Configurator

I cannot access the web configurator.

STEPS	CORRECTIVE ACTION
1	Make sure you are using the correct IP address of the ADSL Router. Check the IP address of the ADSL Router.
2	Make sure that there is not an console session running.
3	Check that you have enabled web service access. If you have configured a secured client IP address, your computer's IP address must match it. Refer to the chapter on remote management for details.
4	For WAN access, you must configure remote management to allow server access from the Wan (or all).
5	Your computer's and the ADSL Router's IP addresses must be on the same subnet for LAN access.

6	If you changed the ADSL Router's LAN IP address, then enter the new one as the URL.
7	Remove any filters in LAN or WAN that block web service.
8	See also Section A.9.

The web configurator does not display properly.

STEPS	CORRECTIVE ACTION
1	Make sure you are using Internet Explorer 5.0 and later versions.
2	Delete the temporary web files and log in again. In Internet Explorer, click Tools, Internet Options and then click the Delete Files ... button. When a Delete Files window displays, select Delete all offline content and click OK. (Steps may vary depending on the version of your Internet browser.)

A.4 Login Username and Password

I forgot my login username and/or password.

STEPS	CORRECTIVE ACTION
1	If you have changed the password and have now forgotten it, you will need to upload the default configuration file. This will erase all custom configurations and restore all of the factory defaults including the password.
2	Press the RESET button for five seconds, and then release it. When the SYS LED begins to blink, the defaults have been restored and the ADSL Router restarts. Or refer to the Resetting the ADSL Router section for uploading a configuration file via console port.
3	The default username is "admin". The default password is "atlantis". The Password and Username fields are case-sensitive. Make sure that you enter the correct password and username using the proper casing.
4	It is highly recommended to change the default username and password. Make sure you store the username and password in a save place.

A.5 LAN Interface

I cannot access the ADSL Router from the LAN or ping any computer on the LAN.

STEPS	CORRECTIVE ACTION
-------	-------------------

1	Check the Ethernet LEDs on the front panel. A LAN LED should be on if the port is connected to a computer or hub. If the 10M/100M LEDs on the front panel are both off, refer to Section A.1.2.
2	Make sure that the IP address and the subnet mask of the ADSL Router and your computer(s) are on the same subnet.

A.6 WAN Interface

Initialization of the ADSL connection failed.

STEPS	CORRECTIVE ACTION
1	Check the cable connections between the ADSL port and the wall jack. The DSL LED on the front panel of the ADSL Router should be on.
2	Check that your VPI, VCI, type of encapsulation and type of multiplexing settings are the same as what you collected from your telephone company and ISP.
3	Restart the ADSL Router. If you still have problems, you may need to verify your VPI, VCI, type of encapsulation and type of multiplexing settings with the telephone company and ISP.

I cannot get a WAN IP address from the ISP.

STEPS	CORRECTIVE ACTION
1	The ISP provides the WAN IP address after authenticating you. Authentication may be through the user name and password, the MAC address or the host name.
2	The username and password apply to PPPoE and PPOA encapsulation only. Make sure that you have entered the correct Service Type, User Name and Password (be sure to use the correct casing).

A.7 Internet Access

I cannot access the Internet.

STEPS	CORRECTIVE ACTION
1	Make sure the ADSL Router is turned on and connected to the network.
2	If the DSL LED is off, refer to Section A.1.3.
3	Verify your WAN settings.
4	Make sure you entered the correct user name and password.

Internet connection disconnects.

STEPS	CORRECTIVE ACTION
1	Check the schedule rules.
2	If you use PPPoA or PPPoE encapsulation, check the idle time-out setting.
3	Contact your ISP.

A.8 Remote Management

I cannot remotely manage the ADSL Router from the LAN or WAN.

STEPS	CORRECTIVE ACTION
1	Refer to the Remote Management Limitations section in the Firmware and Configuration File Management chapter for scenarios when remote management may not be possible.
2	Use the ADSL Router's WAN IP address when configuring from the WAN. Use the ADSL Router's LAN IP address when configuring from the LAN.
3	Refer to Section A.6 for instructions on checking your LAN connection. Refer to Section A.7 for instructions on checking your WAN connection.
4	See also the Section A.4.

A.9 Remote Node Connection

I cannot connect to a remote node or ISP.

STEPS	CORRECTIVE ACTION
1	Check WAN screen to verify that the username and password are entered properly.
2	Verify your login name and password for the remote node.
3	If these steps fail, you may need to verify your login and password with your ISP.

A.10 FAQ

Question	Can I run an application from a remote computer over the wireless network?
Answer	This will depend on whether or not the application is designed to be used over a network. Consult the application's user guide to determine if it supports operation over a network.

Question	Can I play computer games with other members of the wireless network?
Answer	Yes, as long as the game supports multiple players over a LAN (local area network). Refer to the game's user guide for more information.

Question	What is Spread Spectrum?
Answer	Spread Spectrum technology is a wideband radio frequency technique developed by the military for use in reliable, secure, mission-critical communications systems. It is designed to trade off bandwidth efficiency for reliability, integrity, and security. In other words, more bandwidth is consumed than in the case of narrowband transmission, but the trade-off produces a signal that is, in effect, louder and thus easier to detect, provided that the receiver knows the parameters of the spread-spectrum signal being broadcast. If a receiver is not tuned to the right frequency, a spread-spectrum signal looks like background noise. There are two main alternatives, Direct Sequence Spread Spectrum (DSSS) and Frequency Hopping Spread Spectrum (FHSS).

Question	What is DSSS? What is FHSS? And what are their differences?
Answer	Frequency-Hopping Spread-Spectrum (FHSS) uses a narrowband carrier that changes frequency in a pattern that is known to both transmitter and receiver. Properly synchronized, the net effect is to maintain a single logical channel. To an unintended receiver, FHSS appears to be short-duration impulse noise. Direct-Sequence Spread-Spectrum (DSSS) generates a redundant bit pattern for each bit to be transmitted. This bit pattern is called a chip (or chipping code). The longer the chip, the greater the probability that the original data can be recovered. Even if one or more bits in the chip are damaged during transmission, statistical techniques embedded in the radio can recover the original

data without the need for retransmission. To an unintended receiver, DSSS appears as low power wideband noise and is rejected (ignored) by most narrowband receivers.

Question Would the information be intercepted while transmitting on air?

Answer WLAN features two-fold protection in security. On the hardware side, as with Direct Sequence Spread Spectrum technology, it has the inherent security feature of scrambling. On the software side, WLAN offers the encryption function (WEP) to enhance security and access control.

Question What is WEP?

Answer WEP is Wired Equivalent Privacy, a data privacy mechanism based on a 64-bit or 128-bit shared key algorithm, as described in the IEEE 802.11 standard.

Question What is infrastructure mode?

Answer When a wireless network is set to infrastructure mode, the wireless network is configured to communicate with a wired network through a wireless access point.

Question What is roaming?

Answer Roaming is the ability of a portable computer user to communicate continuously while moving freely throughout an area greater than that covered by a single access point. Before using the roaming function, the workstation must make sure that it is the same channel number with the access point of dedicated coverage area.

Question What is ISM band?

Answer The FCC and their counterparts outside of the U.S. have set aside bandwidth for unlicensed use in the ISM (Industrial, Scientific and Medical) band. Spectrum in the vicinity of 2.4 GHz, in particular, is being made available worldwide. This presents a truly revolutionary opportunity to place convenient high-speed wireless capabilities in the hands of users around the globe.

Question	What is the IEEE 802.11g standard?
Answer	Approved in June, 2003 as an IEEE standard for wireless local area networks (WLANs), 802.11g offers wireless transmission over relatively short distances at up to 54 megabits per second (Mbps) compared with the 11 megabits per second of the 802.11b (Wi-Fi) standard. Like 802.11b, 802.11g operates in the 2.4 GHz range and is thus compatible with it.

APPENDIX B: Technical Features

Protocols	IP, NAT, ARP, ICMP, IGMP, DHCP(server, client and relay), RIP1/2 , SNMP client, UPnP, Telnet server, SNMP
LAN port	4 x RJ45 10/100 Base-T port
WAN port	RJ-11 (1 port ADSL)
Antenna	3*2.2dBi external fixed Antennas
Wireless	IEEE802.11n(Draft V2.0)/IEEE802.11g/IEEE802.11b
Wireless Security	WPA2-PSK, WPA-PSK , WEP 128 and WEP 64
External buttons	Reset/WPS
LED Indicators	Power, 4 X Lan, WLAN, WPS, ADSL and Internet
Standard ADSL Compliance	<p>ADSL:</p> <ul style="list-style-type: none"> - Full Rate ANSI T1.413 issue 2 - ITU G.992.1 (G.dmt), ITU G.992.2 (G.lite), ITU G.994.1 (G.hs) <p>ADSL2:</p> <ul style="list-style-type: none"> - ITU G.992.3 (G.dmt.bis) [up to 12Mbps download, up to 1 Mbps upload] - ITU G.992.3 (Annex M) [up to 12Mbps download, up to 2 Mbps upload] <p>ADSL2+:</p> <ul style="list-style-type: none"> - ITU G.992.5 (G.dmt.bisplus) [up to 24Mbps download, up to 1 Mbps upload] - ITU G.992.5 (Annex M) [up to 24Mbps download, up to 2.5 Mbps upload]
Protocols ADSL	RFC2364(PPPoA), RFC2516(PPPoE) and RFC1483
ATM	ATM AAL2/AAL5 and ATM service class : CBR, UBR, VBR-rt, VBR, ATM Forum UNI 3.0, 3.1 and 4.0
Firewall	Packet Filtering (up to 72 rules), URL Filtering, Application Filtering, MAC Filtering, SPI, DoS and NAT
QoS	The Quality of Service feature ensures a smooth net connection for inbound and outbound data with minimal traffic congestion
VPN	Pass Through
Dynamic DNS	Available (www.dyndns.org)
Input Power	12V DC @ 1A
Power	< 9watts

Consumption	
Agency and Regulatory	CE
Dimensions	190mm x 120mm x 47mm
Weight	350g
Operating Temperature	0° to 40°C
Storage Temperature	-10° to 70°C
Operating Humidity	10-85% non-condensing

APPENDIX C:Support

If you have any problems with the WebShare Wireless Router ADSL2+, please consult this manual. If you continue to have problems you should contact the dealer where you bought this ADSL Router. If you have any other questions you can contact the Atlantis Land company directly at the following address:

Via Pelizza da Volpedo, 59
20092 Cinisello Balsamo (MI) Italy
Tel: +39. 02.93906085, +39. 02.93907634(help desk)
Fax: +39. 02.93906161

Email: info@atlantis-land.com or tecnici@atlantis-land.com
WWW: <http://www.atlantis-land.com>
